<b>HOW TO READ THE PARAMETERS?</b>	6
<b>SAFETY NOTICE</b>	7
<b>CHAPTER 1 PRODUCT INTRODUCTION</b>	11
1.1 PRODUCT INSPECTIONS .....	11
1.2 PRODUCT MODEL IDENTIFICATIONS .....	12
<i>1.2.1 Description of nameplate</i> .....	12
<i>1.2.2 Model identifications</i> .....	13
1.3 SERVO DRIVE AND MOTOR MATCHING TABLE .....	15
1.4 MAINTENANCE AND INSPECTIONS .....	16
1.5 NAME OF EACH PART OF THE SERVO DRIVER .....	16
<b>CHAPTER 2 INSTALLATIONS</b>	17
2.1 INSTALLATION DIRECTION AND SPACE .....	17
2.2 RECOMMENDED SPECIFICATIONS OF CIRCUIT-BREAKER AND FUSE .....	18
2.3 COUNTERING NOISE INTERFERENCE AND HIGHER HARMONICS .....	18
<i>2.3.1 Installation of EMI filter</i> .....	19
<i>2.3.2 Connection of AC/DC reactor for suppression of higher harmonic</i> .....	19
2.4 SELECTION OF REGENERATIVE RESISTORS .....	20
<b>CHAPTER 3 WIRINGS</b>	21
3.1 SYSTEM STRUCTURE AND WIRING .....	21
<i>3.1.1 Servo system structure</i> .....	21
<i>3.1.2 Servo drive connectors &amp; terminals</i> .....	22
<i>3.1.3 Main circuit wirings</i> .....	22
3.2 WIRINGS BETWEEN SERVO DRIVE & SERVO MOTOR .....	24
<i>3.2.1 Configurations &amp; definitions of quick plug terminals</i> .....	24
<i>3.2.2 Configurations and definitions of aviation plug terminals</i> .....	24
3.3 WIRINGS OF CN1 (RS485 COMMUNICATION) .....	25
3.4 WIRINGS OF CN2 (I/O SIGNALS) .....	25
<i>3.4.1 Pin arrangement of CN2 connector</i> .....	25
<i>3.4.2 CN2 signal descriptions</i> .....	27
<i>3.4.3 Allocation of I/O signals</i> .....	29
<i>3.4.4 Examples of connection with upper controllers</i> .....	36
3.5 WIRINGS OF CN3 (FEEDBACK FROM ENCODER TO SERVO DRIVE) .....	40
<i>3.5.1 Pin arrangement of CN3 connector</i> .....	40
<i>3.5.2 Examples of CN3 connections</i> .....	41
3.6 STANDARD WIRING DIAGRAMS .....	42
<i>3.6.1 Position control</i> .....	42
<i>3.6.2 Speed/torque control</i> .....	43
<b>CHAPTER 4 PANEL OPERATIONS</b>	44
4.1 PANEL OPERATOR .....	44

4.2 SWITCH BETWEEN DIFFERENT FUNCTIONS .....	44
4.3 STATUS CODE DISPLAY .....	45
4.4 MONITORING DISPLAY MODE (DP □□) .....	46
<i>4.4.1 Contents of monitoring display mode.....</i>	<i>46</i>
<i>4.4.2 Example of operations at monitoring display mode (dP 00).....</i>	<i>46</i>
4.5 PARAMETER MODE (PA □□□) .....	47
<i>4.5.1 Remarks at parameter mode .....</i>	<i>47</i>
<i>4.5.2 Example of operations at parameter mode (PA100) .....</i>	<i>48</i>
4.6 AUXILIARY FUNCTION MODE (AF □□) .....	49
<i>4.6.1 Contents of auxiliary function mode .....</i>	<i>49</i>
<i>4.6.2 Example of operations at auxiliary function mode (AF 05) .....</i>	<i>49</i>
<b>CHAPTER 5 MONITORING DISPLAY PARAMETERS.....</b>	<b>50</b>
5.1 LIST OF MONITORING DISPLAY PARAMETERS .....	50
5.2 INPUT SIGNAL MONITORING (DP 12) .....	52
<i>5.2.1 Operations of entering dP 12 .....</i>	<i>52</i>
<i>5.2.2 Explanations of dP 12 LED displays.....</i>	<i>52</i>
<i>5.2.3 Examples of dP 12 LED displays .....</i>	<i>53</i>
5.3 OUTPUT SIGNAL MONITORING (DP 13).....	54
<i>5.3.1 Operations of entering dP 13 .....</i>	<i>54</i>
<i>5.3.2 Explanations of dP 13 LED displays.....</i>	<i>54</i>
<i>5.3.3 Examples of dP 13 LED displays .....</i>	<i>55</i>
5.4 INITIAL MONITORING DISPLAY AT POWER ON .....	55
5.5 DISPLAY RANGE OF DP 01~DP 06 .....	55
<b>CHAPTER 6 AUXILIARY FUNCTIONS.....</b>	<b>56</b>
6.1 LIST OF AUXILIARY FUNCTION PARAMETERS.....	56
6.2 DISPLAY OF ERROR LOGGING (AF 00).....	57
6.3 POSITION ASSIGNMENT (AF 01).....	58
6.4 JOG RUN (AF 02).....	59
6.5 PANEL LOCK (AF 03).....	60
6.6 CLEARANCE OF ALARM LOGGING (AF 04).....	61
6.7 PARAMETER INITIALIZATION (AF 05).....	62
6.8 ANALOG INSTRUCTION AUTOMATIC OFFSET ADJUSTMENT (AF 06).....	63
6.9 SPEED INSTRUCTION MANUAL OFFSET ADJUSTMENT (AF 07) .....	64
6.10 TORQUE INSTRUCTION MANUAL OFFSET ADJUSTMENT (AF 08) .....	65
6.11 OVERVIEW OF RELEVANT MOTOR PARAMETERS (AF 09).....	66
6.12 DISPLAY OF MAIN SOFTWARE VERSION OF SERVO DRIVE (AF 10).....	67
6.13 SETTING UP ABSOLUTE ENCODERS (AF 11).....	68
6.14 MANUAL DETECTION OF LOAD INERTIA (AF 15).....	69
<b>CHAPTER 7 JOG RUN.....</b>	<b>70</b>
7.1 PREPARATIONS BEFORE JOG RUN.....	70
7.2 JOG RUN BY PANEL OPERATIONS .....	70
7.3 STAND-ALONE JOG RUN WITH UPPER CONTROLLERS .....	70

7.3.1 <i>Wiring &amp; status check of input signal circuit</i> .....	70
7.3.2 <i>JOG run in position control mode</i> .....	71
7.3.3 <i>JOG run in speed control mode</i> .....	72
7.4 JOG RUN WITH MECHANICAL CONNECTIONS .....	73
7.5 JOG RUN WITH A HOLDING BRAKE.....	73
<b>CHAPTER 8 SERVO OPERATIONS .....</b>	<b>74</b>
8.1 CONTROL MODE SELECTIONS .....	74
8.2 BASIC FUNCTION SETTINGS .....	75
8.2.1 <i>S-ON settings</i> .....	75
8.2.2 <i>Switch of motor rotational directions</i> .....	76
8.2.3 <i>Overtravel (OT) settings</i> .....	77
8.2.4 <i>Holding brake settings</i> .....	79
8.2.5 <i>Selection of servo stop patterns at servo OFF</i> .....	83
8.2.6 <i>Instantaneous power off settings</i> .....	84
8.2.7 <i>Analog voltage output</i> .....	85
8.3 USING ABSOLUTE ENCODERS.....	86
8.3.1 <i>Absolute encoder selection</i> .....	86
8.3.2 <i>Using battery for absolute encoder</i> .....	86
8.3.3 <i>Battery replacement</i> .....	87
8.3.4 <i>Setting up absolute encoders (AF II)</i> .....	87
8.4 POSITION CONTROL OPERATIONS .....	88
8.4.1 <i>Parameter settings</i> .....	88
8.4.2 <i>Electronic gear</i> .....	89
8.4.3 <i>Position instructions</i> .....	90
8.4.4 <i>Smoothness</i> .....	91
8.4.5 <i>Positioning completed signal (COIN)</i> .....	92
8.4.6 <i>Positioning near signal (NEAR)</i> .....	93
8.4.7 <i>Pulse input inhibited (INHIBIT)</i> .....	93
8.5 SPEED CONTROL OPERATIONS.....	94
8.5.1 <i>Parameter settings</i> .....	94
8.5.2 <i>Input signals</i> .....	94
8.5.3 <i>Instruction offset adjustment</i> .....	96
8.5.4 <i>Soft start</i> .....	97
8.5.5 <i>Speed instruction filter time constant</i> .....	97
8.5.6 <i>Zero-speed clamp function</i> .....	98
8.5.7 <i>Encoder signal output</i> .....	99
8.5.8 <i>Speed instruction reached (VCMP)</i> .....	101
8.6 TORQUE CONTROL OPERATIONS.....	102
8.6.1 <i>Parameter settings</i> .....	102
8.6.2 <i>Input signals</i> .....	103
8.6.3 <i>Instruction offset adjustment</i> .....	104
8.6.4 <i>Speed limit in torque control mode</i> .....	105
8.7 INTERNAL SPEED CONTROL.....	106
8.7.1 <i>Parameter settings</i> .....	107

<i>8.7.2 Input signals</i> .....	107
8.8 INTERNAL POSITION CONTROL.....	108
<i>8.8.1 Parameter settings</i> .....	109
<i>8.8.2 Input signals</i> .....	111
<i>8.8.3 Output signals</i> .....	114
8.9 HOMING FUNCTION .....	115
8.10 COMBINATION OF DIFFERENT CONTROL MODES.....	121
<i>8.10.1 Parameter settings</i> .....	121
<i>8.10.2 Input signal</i> .....	121
<b>CHAPTER 9 FAULT DIAGNOSIS .....</b>	<b>122</b>
9.1 ALARMS .....	122
9.2 WARNINGS.....	126
<b>CHAPTER 10 COMMUNICATIONS.....</b>	<b>127</b>
10.1 COMMUNICATION TERMINALS .....	127
10.2 COMMUNICATION PARAMETERS.....	127
10.3 COMMUNICATION PROTOCOL.....	128
<i>10.3.1 Encoding definitions</i> .....	128
<i>10.3.2 Byte structure</i> .....	129
<i>10.3.3 Communication data structure</i> .....	130
<i>10.3.4 Communication troubleshooting</i> .....	137
10.4 COMMUNICATION ADDRESS .....	138
<b>CHAPTER 11 PRODUCT SPECIFICATIONS.....</b>	<b>140</b>
11.1 SERVO DRIVE SPECIFICATIONS .....	140
<i>11.1.1 Basic specifications</i> .....	140
<i>11.1.2 Position/speed/torque control specifications</i> .....	141
<i>11.1.3 Servo drive dimensions</i> .....	142
11.2 SERVO MOTOR SPECIFICATIONS & DIMENSIONS .....	143
<b>CHAPTER 12 APPENDIX .....</b>	<b>146</b>
12.1 LIST OF MONITORING DISPLAY FUNCTIONS .....	146
12.2 LIST OF AUXILIARY FUNCTION PARAMETERS.....	148
12.3 LIST OF PARAMETERS .....	149

# How to read the parameters?

- **High place/Low place explanation**

Sometimes one parameter value is two parameter values combined together. For example, High place is 1234 and low place is 5678, then the combined value is 12345678.

Also for hexadecimal data can be 16-bit or 32-bit. 32-bit data consists of two 16-bit data (two parameters, high/low place). For example, 0781H data is 0001H and 0782H data is 013AH; then absolute encoder single turn data is 0001013AH.

- **Parameter 1/2/3/4 explanations**

Parameter	Function	Range	Unit	Default	Effective	Remarks
PA200	Position control switch	d.0000~d.1232	—	0000	Restart	

# Safety Notice

This section will introduce the main instructions that users shall follow during the receiving, storage, handling, installation, wiring, operation, inspection and disposal of the products.

## DANGER

### ■ Input power

Input power of the servo drive is 220VAC (-15%~+10%) or 380VAC (-15%~+15%).

### ■ When installed to a machine, the servo motor shall be able to do emergency stop at any moment.

Otherwise, there may be personnel injuries and mechanical failure.

### ■ When the power is on, the power supply terminals must be properly housed.

Otherwise, there may be electric shocks.

### ■ After power off or voltage withstand test, when the charge indication light (CHARGE) is on, do not touch the power supply terminals.

Otherwise, there may be electric shocks caused by residual voltage.

### ■ Please do trial run (JOG) following the procedures and instructions of this user manual.

Otherwise, there may be personnel injuries and mechanical failure.

### ■ Do not make any alterations to this product. Only qualified/designated persons can configure, dismantle or repair this product.

Otherwise, there may be personnel injuries, mechanical failure or fire.

### ■ Please install stop mechanisms on the machine side to ensure safety.

The holding brake of the servo motor is not a device designed to ensure safety.

Otherwise, there may be injuries.

### ■ Please ensure to connect the earth terminal of servo drive with the earth electrode (the earth resistance of servo drive for power input is below 100Ω).

Otherwise, there may be electric shocks or fire.

## ATTENTION: STORING & TRANSPORTING

### ■ The product shall not be stored or used in below environment:

(Otherwise, there may be fire, electric shocks or machinery breakdown.)

- The place with direct sun light;
- The place where temperature exceeds the limits for storage and using;
- The place where the relative humidity exceeds the limits for storage and using;
- The place with corrosive or flammable gases;
- The place with too much dust, dirt, and too many saline matters and metal powders;
- The place prone to water, oil and chemicals splashes;
- The place where vibrations or shocks may affect the principal parts.

### ■ Please do not transport the product by grasping the cables, motor shafts or encoders.

Otherwise, there may be personnel injuries or machine breakdown.

## ATTENTION: INSTALLATIONS

- Please do not block the air inlet and outlet, and prevent alien matters entering the product.  
Otherwise, the inner components may be aged and cause failure or fire.
- Please install at correct directions.  
Otherwise, there may be failure.
- During installation, please ensure there is enough space between the servo drive and internal surface of control cabinet and other electrical parts.  
Otherwise, there may be fire or machine breakdown.
- Please do not impose too big impacts.  
Otherwise, there may be machine breakdown.

## ATTENTION: WIRING

- Please connect wires correctly and reliably.  
Otherwise, there may be out-of-control of motor, personnel injuries or machine fault.
- Please DO NOT connect commercial power supply to the UVW terminals of the servo drive.  
Otherwise, there may be personnel injuries or fire.
- Please connect the UVW terminals with the servo motor firmly.  
Otherwise, there may be a fire.
- Please do not house the main circuit cables, input-output signal cables and encoder cables with the same bushing, or tie them together. During wiring, the main circuit cables shall be at least 30cm from the input-output signal cable.
- Cables for input-output signal and encoder shall be twin strands or multiple-core twinning bulk shielding strands.
- Maximum length of input-output signal cable: 3m;  
Maximum length of encoder cable: 30m.
- Even when the power is turned off, there may still be residual high voltage inside the servo drive, so when the charge indication light (CHARGE) is on, do not touch the power terminals.  
Please connect or check wirings after the charge indication light (CHARGE) is off.
- Please install circuit breakers to prevent external short-circuit.  
Otherwise, there may be a fire.
- When used in the following places, please take appropriate measures for shielding:
  - When there may be interference of static electricity
  - The place with strong electric field or high intensity field
  - The place where there may be radioactive raysOtherwise, there may be machinery breakdown.
- When connecting to batteries, pay attention to the polarity.  
Otherwise, it may lead to the damage and explosion of batteries, servo drive and servo motor.

## ATTENTION: OPERATIONS

- In order to prevent accidents, please conduct trial run (JOG) before connecting to mechanical parts.  
Otherwise, there may be injuries.
- Before running, please set the appropriate parameters.  
Otherwise, the machine may be out of control or have failure.
- Please do not turn on/off the power supply frequently.  
Because the power section of servo drive has capacitors, when the power is on, heavy charging current may flow through them. Therefore, if the power is frequently turned on/off, perseverance of the main circuit components inside the servo drive may decline.
- During JOG operation (AF 02) and manual load inertia detection (AF 15), please note that the emergency stop will become ineffective at over-travel.  
Otherwise, there may be machinery breakdown.
- When the servo motor is used on the vertical axis, please set a safety device, in case workpiece drops when there is alarm or over-travel. Besides, please set up zero-position fixation when there is over-travel.  
Otherwise, the workpiece may drop when there is over-travel.
- Extreme or alternative parameter settings may cause the servo system to be instable.  
Otherwise, there may be personnel injuries and machinery breakdown.
- When there are alarms, please reset the alarm after finding out the causes and ensure operation safety, and then start operation again.  
Otherwise, there may be machinery breakdown, fire or personnel injuries.
- The holding brake (optional) of the servo motor is designed for maintaining positions, NOT for servo motor braking at decelerations.  
Otherwise, there may be machine fault.
- The servo motor and servo drive shall be used in combinations as specified.  
Otherwise, there may be fire or machine breakdown.

## ATTENTION: MAINTENANCE

- **Please do not change the wiring when the power is on.**  
Otherwise, there may be electric shocks or personnel injuries.
- **When replacing the servo drive, please copy parameters to the new servo drive, and then start operation again.**  
Otherwise, there may be machinery breakdown.

## ATTENTION: OTHERS

- In order to give explicit explanations, housing or safety protection devices are omitted in some drawings in this user manual. During real operations, please make sure to install the housing or safety protection devices according to the instructions of the user manual.
- Illustrations in this manual are representative graphic symbols, which may be different from the products that you receive.
- During the commissioning and use of servo drive, please install the relevant safety protection devices. Our company will not bear any liability for the special losses, indirect losses and other relevant losses caused by our products.
- This manual is general descriptions or characteristic which may not always be the case in practical use, or may not be completely applicable when the products are further improved.

# Chapter 1 Product Introduction

## 1.1 Product inspections

Please check the items listed in the table below carefully, in case there is negligence during the purchase and transport of the product.

Items to inspect	Reference
Whether the product received is the right one you intend to buy?	Check the product model on the motor and driver nameplate respectively. Please refer to the notes to model in following sections.
Whether the motor shaft runs smoothly?	Rotate the rotor shaft of the motor. If it can rotate smoothly, the rotor shaft is normal. <b>Note that the motor with electro-magnetic brake (holding brake) cannot be rotated with hands!</b>
Check whether there are any appearance damages?	Check visually whether there are any appearance damages.
Whether there are loosened screws?	Check whether the mounting screws of servo drive is loosened with a screw driver.

Please contact your vendor if anything above occurs.

A complete set of servo components shall include the following:

No.	Reference
1	Servo drive and its matching servo motor.
2	Motor power line: supplies power from servo drive to servo motor.
3	Motor encoder line: transmits signals from motor encoder to servo drive.
4	RJ45 plug for CN1: RS485 communication (optional)
5	50-PIN plug for CN2 (3M simulation product) (optional)
6	20-PIN plug for CN3 (A, B type case only) (3M simulation product) (optional)
7	5-PIN plug for servo drive (A, B type case only) input power supply: L1. L2. L3. L1C. L2C
8	5-PIN plug for external braking resistor and DC reactor (A, B type case only) : (P, D, C, -1, -2)
9	Two metal pieces for short-circuiting (except E type case)
10	One copy of user manual

## 1.2 Product model identifications

### 1.2.1 Description of nameplate

- Description of the nameplates of EPS-B2 series servo drives

## 1.2.2 Model identifications

Note: drive and motor models can be updated from time to time. Please contact our after-sales service for updated information.

### ■ Description of the models of EPS-B2 servo drive

## 1.4 Maintenance and inspections

Please make regular maintenance and inspection of the drive and motor for safe and easy use. Routine and periodical inspections shall be carried out according to the following items

Type	Period	Items
Routine inspections	Daily	<ul style="list-style-type: none"><li>• Whether there are dirt and or substances.</li><li>• Whether there is abnormal vibration and sound</li><li>• Whether the input supply voltage is normal</li><li>• Whether there is abnormal smell</li><li>• Whether there are fiber stubs stuck to the ventilation opening</li><li>• Whether the front end of driver and the connector are clean</li><li>• Whether there the connection with control device and equipment motor is loose and whether the core feet deviates</li><li>• Whether there are foreign matters in the load part</li></ul>
Periodical inspections	Yearly	<ul style="list-style-type: none"><li>• Whether the fastening parts are loose</li><li>• Whether it is superheated</li><li>• Whether the terminal is damaged or loose</li></ul>

## 1.5 Name of each part of the servo driver

# Chapter 2 Installations

## 2.1 Installation direction and space

The installation direction must be in accordance with the regulations, otherwise it will cause malfunctions. In order to make a good cooling effect, the upper and lower, left and right with the adjacent items and baffle (wall) must have enough space, otherwise it will cause malfunctions. The AC servo drive's suction, exhaust hole cannot be sealed, nor placed upside down, otherwise it will cause malfunctions.

In order to lower the wind resistance to the radiator fan and let heat discharge effectively, users shall follow the recommended installation spacing distance of one or several AC servo drivers (see the figure below).

## 2.2 Recommended specifications of circuit-breaker and fuse

### ■ 220V class

Servo drive case type	Circuit-breaker	Fuse (class T)
A	10A	20A
B	20A	40A
C	30A	80A

Note:

1. Strongly recommended: the fuse and circuit-breaker must comply with UL/CSA standards.
2. When an earth leakage circuit breaker (ELCB) is added for leakage protections, please choose ELCB with sensitivity current over 200mA and action time over 0.1s.

## 2.3 Countering noise interference and higher harmonics

The main circuit of servo drive uses a high-speed switching device, so the peripheral wiring and earthing of servo drive may be affected by the noise of the switching device. In order to prevent noise, the following measures can be taken:

- ◆ Please install EMI filter on the main power supply side;
- ◆ Connection of AC/DC reactor for suppression of higher harmonic;
- ◆ Please install the command input equipment (such as PLC) and EMI filter as close as possible to the servo drive;
- ◆ The power line (cable for power supply from servo drive to servo motor) shall be over 30cm from the input-output signal cable. Do not house them in the same bushing or tie them together.
- ◆ Do not use the same power supply with a welding machine or electro spark machine.
- ◆ When there is a high frequency generating device nearby, an EMI filter shall be connected to the input side of the main circuit cable.
- ◆ Ensure the earthing is appropriate.

### 2.3.1 Installation of EMI filter

In order to ensure the EMI filter can fully suppress the interference, please note:

Item	Reference
1	Servo drives and EMI filters must be installed on the same metal surface.
2	The wiring has to be as short as possible.
3	The metal surface shall be well grounded.
4	The metal housing or earthing of both servo drive and EMI filter shall be reliably fixed to the metal surface, with the contact area as big as possible.
5	The motor power line shall have shielded (double shielding layer is preferred).
6	Ground shielding copper with the shortest distance and maximum contact.

### 2.3.2 Connection of AC/DC reactor for suppression of higher harmonic

An AC/DC reactor can be connected to the servo drive for suppression of higher harmonic. Please connect the reactor according to the figure below:

## 2.4 Selection of regenerative resistors

When the motor is outputting torque opposite to the rotating direction, energy is regenerated from the load to the drive. DC bus voltage will rise and at a certain level, the regenerated energy can only be consumed by the regenerative resistor. The drive contains an internal regenerative resistor, and users can also connect an external regenerative resistor. The table below shows the specifications of regenerative resistor contained in EPS-B2 series servo drives.

Servo drive case type	Internal regenerative resistor specs		Minimum allowable resistance value (Ohm)
	Resistance (Ohm)	Capacity (Watt)	
A	-	-	30
B	30 (220V)	60	20
C	30 (220V) \ 40 (380V)	80	13 (220V) \ 30 (380V)

When the regenerative capacity exceeds the disposable capacity of the internal regenerative resistor, an external regenerative resistor shall be connected. Please note:

Item	Reference
1	Please set the external resistor value and capacity correctly.
2	The external resistance value shall not be smaller than the minimum allowable resistance value. If parallel connection is to be used to increase the power, please confirm whether the resistance value satisfies the limiting conditions.
3	In natural environment, when the disposable regenerated capacity (mean value) of regenerative resistor is used within the limit of nominal capacity, the temperature of resistor will rise to be above 120°C (under continual regeneration). In order to ensure safety, it is suggested to use a regenerative resistor with a thermo-switch.
4	When external regenerative resistor is used, the resistor shall be connected to P, C end, and P, D end shall be open. External regenerative resistor shall follow the resistance value suggested in the table above.

# Chapter 3 Wirings

## 3.1 System structure and wiring

### 3.1.1 Servo system structure

### 3.1.2 Servo drive connectors & terminals

Markings	Descriptions	Reference
<b>L1, L2, L3</b>	Main circuit input power terminals	Connect to 1/3 PH AC power supply. (Please choose correctly)
<b>L1C, L2C</b>	Control circuit input power terminals	Connect 1PH AC power supply. (Please choose correctly)
<b>P, D, C</b>	Regenerative resistor terminals	<ul style="list-style-type: none"> <li>Internal regenerative resistor: make PD short circuit, PC open.</li> <li>External regenerative resistor: connect PC to external resistor, PD open.</li> </ul>
<b>Θ1, Θ2</b>	DC Reactor terminals	Connect $\Theta^1$ & $\Theta^2$ to DC reactor.
<b>U, V, W</b>	Servo motor power supply terminals	Connect with the servo motor
	Earth terminal	Connect with input power supply & motor power supply earth terminals for grounding.
<b>CN1</b>	RJ45 jack	RS-485 communication
<b>CN2</b>	I/O connector	Connect with upper controller
<b>CN3</b>	Encoder connector	Connect with the motor encoder

### 3.1.3 Main circuit wirings

#### 1) Cable diameter requirement

Mark	Name	Cable diameter: mm <sup>2</sup> (AWG)				
		EPS-B1-				
		0D20A	0D40A	0D75A	0001A	01D5A
<b>L1, L2, L3</b>	Main circuit input power terminals	1.25 (AWG-16)		2.0 (AWG-14)		
<b>L1C, L2C</b>	Control circuit input power terminals		1.25 (AWG-16)			
<b>U, V, W</b>	Servo motor power supply terminals	1.25 (AWG-16)		2.0 (AWG-14)		
<b>P, D, C</b>	Regenerative resistor terminals		1.25 (AWG-16)			
	Earth wire		Above 2.0 (AWG-14)			

#### 2) Typical main circuit wiring example

- When the signal of ALM is active, power supply of the main circuit shall be OFF.
- Main circuit & control circuit shall be powered on at the same time, or the control circuit first.
- The main circuit shall be powered off before the control circuit.

■ 1PH 220VAC:

■ 3PH 220VAC/380VAC:

## 3.2 Wirings between servo drive & servo motor

### 3.2.1 Configurations & definitions of quick plug terminals

### 3.2.2 Configurations and definitions of aviation plug terminals

### 3.3 Wirings of CN1 (RS485 communication)

#### 1) Terminal appearance

#### 2) Signal definitions

Mark	Name	Function
1, 9	RS485+	RS485+ Signal
2, 10	RS485-	RS485- Signal
3, 11	GND	Ground
4, 12	NC	-
5, 13	NC	-
6, 14	GND	Ground
7, 15	CANH	-
8, 16	CANL	-
Housing	FG	Shielding

### 3.4 Wirings of CN2 (I/O signals)

#### 3.4.1 Pin arrangement of CN2 connector

1	DO4+	Digital Output 4 (+)				31	DI7	Digital Input 7
2	DO3-	Digital Output 3 (-)	16	SG	GND	32	DI6	Digital Input 6
3	DO3+	Digital Output 3 (+)	17	+24V	24V Output (+)	33	DI5	Digital Input 5
4	DO2-	Digital Output 2 (-)	18	T-REF	Torque instruction Input (+)	34	DI3	Digital Input 3
5	DO2+	Digital Output 2 (+)	19	AGND	Torque instruction Input (-)	35	PL	Open collector power input
6	DO1-	Digital Output 1 (-)	20	V-REF	Speed instruction Input (+)	36	/HPULS	High speed pulse Input (-)
7	DO1+	Digital Output 1 (+)	21	PAO	Encoder output A+	37	/SIGN	Sign Input (-)
8	DI4	Digital Input 4	22	/PAO	Encoder output A-	38	HPULS	High speed pulse Input (+)
9	DI1	Digital Input 1	23	/PBO	Encoder output B-	39	SIGN	Sigh Input (+)
10	DI2	Digital Input 2	24	/PZO	Encoder output Z-	40	/ HSIGN	High speed pulse Input (-)
11	COM+	External 24V Input	25	PBO	Encoder output B+	41	/PULS	Pulse input (-)
12			26	DO4-	Digital Output4 (-)	42	HSIGN	High speed sign Input (+)
13	PZO	Encoder output Z+	27			43	PULS	Pulse input (+)
14	24V-GND	24V Output (-)	28			44	MON	Analog output
15			29	AGND	Speed instruction Input (-)			
			30	DI8	Digital Input 8			

Notes:

- 1) do not use vacant terminals.
- 2) Connect the shielding of control line (I/O cable) to the connector housing to achieve FG (frame grounding)
- 3) except for the CN2-6/7, all input and output pins can change signal allocations by parameters.
- 4) Maximum output current of internal 24V is 300mA. If internal 24V is used, internal 5V will lose power very quickly. Therefore, after editing parameters, saving has to be done in a special way. (First set PA006=0000, the edit the parameters, then set PA006=0080, PA006 will change to 0100 automatically).

### 3.4.2 CN2 signal descriptions

- Name and function of input signals (with default pin allocations)

Mode	Signal	Pin No.	Function
Universal	S-ON	9	Servo ON: The motor is powered on.
	C-MOD	10	Control mode switch: Switch between two control modes.
	POT	34	Forward rotation prohibited
	NOT	8	Reverse rotation prohibited
	CLR	33	Overtravel prohibited: Stop operation of servo motor when it is on.
	A-RESTART	32	Clear position deviation pulses counter during position control.
	INHIBIT	31	Reset alarms
	ZEROSPD	30	Pulse input inhibited
	COM+	11	Zero-speed clamp signal input
Position control	HPULS+	38	External 24VDC for I/O signals
	HPULS-	36	High-speed channel pulse input
	HSIGN+	42	* Sign+pulse train
	HSIGN-	40	* CCW+CW Pulse train
	PULS+	43	* A + B Pulse train
	PULS-	41	Low-speed channel pulse input level:
	SIGN+	39	* Sign+pulse train
	SIGN-	37	* CCW+CW Pulse train
Speed control	PL	35	* A + B Pulse train
	V-REF	20	Open collector pulse signal terminal
Torque control	AGND	29	Speed instruction voltage input
	T-REF	18	Torque instruction voltage input
	AGND	19	

- Name and function of output signals (with default pin allocations)

Mode	Signal	Pin No.	Function		
Universal	PAO+	21	A phase signal	Two-phase pulse (A phase and B phase) encoder frequency dividing signal output	
	PAO-	22			
	PBO+	25	B phase signal		
	PBO-	23			
	PZO+	13	Z phase signal	Original point (Z phase) signal output	
	PZO-	24			
	ALM+	7	Servo alarm: <b>OFF when abnormal state is detected.</b>		
	ALM-	6			
	COIN+	5	Positioning completed: Under position control mode, when deviation pulse is smaller than PA525, the signal is active.		
	COIN-	4			
	CZ+	3	Optocoupler Z phase pulse output		
	CZ-	2			
	BK+	1	External brake signal output		
	BK -	26			
	MON	44	Speed or torque analog output. Voltage range $\pm 8V$ .		
	SG	16			

### 3.4.3 Allocation of I/O signals

#### 1) Allocation of input signals

- Default input signal allocations

PA	Description	Range	Unit	Default	Effective
PA500	<p><b>DI 1 input signal selection</b></p> <p>[0] Servo-on (S-ON)  [1] Control mode switch (C-MODE)  [2] Forward rotation prohibited (POT)  [3] Reverse rotation prohibited (NOT)  [4] Deviation counter clearance (CLR)  [5] Alarm reset (A-RESTART)  [6] Pulse input inhibited (INHIBIT)  [7] Zero-speed clamp (ZEROSPD)  [8] Forward torque limitation (PCL)  [9] Reverse torque limitation (NCL)  [10] Gain switch (GAIN)  [11] Zero switch signal (ZPS)  [12] Negation signal for internal position control &amp; internal speed control (CMDINV)  [13] Instruction division/ multiplication switch 0 (DIV0)</p> <p>[14] Instruction division/ multiplication switch 1 (DIV1)  [15] Internal speed register 0 (INSPD0)  [16] Internal speed register 1 (INSPD1)  [17] Internal speed register 2 (INSPD2)  [18] Internal position register 0 (INPOS0)  [19] Internal position register 1 (INPOS1)  [20] Internal position register 2 (INPOS2)  [21] Internal position register 3 (INPOS3)  [22] Internal position control trigger (PTRG)  [23] Internal position control Forward JOG (P-POS)  [24] Internal position control Reverse JOG (N-POS)  [25] Internal position control homing start (SHOME)  [26] Internal position control stop (PZERO)  [28] Internal torque register 0 (INTor0)  [29] Internal torque register 1 (INTor1)  [30] Incremental/Absolute mode selection in internal position control mode (PAbs)</p>	0~30		0	Immediate

<b>PA501</b>	DI 2 input signal selection	0~30		1	Immediate
<b>PA502</b>	DI 3 input signal selection	0~30		2	Immediate
<b>PA503</b>	DI 4 input signal selection	0~30		3	Immediate
<b>PA504</b>	DI 5 input signal selection	0~30		4	Immediate
<b>PA505</b>	DI 6 input signal selection	0~30		5	Immediate
<b>PA506</b>	DI 7 input signal selection	0~30		6	Immediate
<b>PA507</b>	DI 8 input signal selection	0~30		7	Immediate

- Default signals and corresponding pins of DI 1~ DI 8:

Parameter No.	Terminal name	CN2 pin	Default signal
PA500	DI 1	9	S-ON
PA501	DI 2	10	C-MOD
PA502	DI 3	34	POT
PA503	DI 4	8	NOT
PA504	DI 5	33	CLR
PA505	DI 6	32	A-RESTART
PA506	DI 7	31	INHIBIT
PA507	DI 8	30	ZEROSPD

- Level selection of input signals

PA	Description	Range	Unit	Default	Effective
PA508	<p><b>Level selection of input signal 0</b></p> <p><b>b.0001: DI 1 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p> <p><b>b.0010: DI 2 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p> <p><b>b.0100: DI 3 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p> <p><b>b. 1000: DI 4 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p>	b.0000 ~1111		b.0000	Immediate
PA509	<p><b>Level selection of input signal 1</b></p> <p><b>b.0001: DI 5 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p> <p><b>b.0010: DI 6 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p> <p><b>b.0100: DI 7 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p> <p><b>b. 1000: DI 8 input signal level selection;</b>  [0] L level active (optocoupler conductive)  [1] H level active (optocoupler not conductive)</p>	b.0000 ~1111		b.0000	Immediate

- Change level selection of input signals

When signals like S-ON, POT, NOT are used through "polarity inversion", if there are abnormal states like breakage of signal line, it will cause movement deviating from the safety direction. If such setting has to be adopted, please confirm the action and ensure there are no safety problems.

The typical circuit of input signal is as follows:

Take the above figure as an example. When the optocoupler is conductive, S-ON signal is L level; when the optocoupler is not conductive, S-ON signal is H level. Parameter PA508 decides the active level of S-ON. When PA508.0=0, S-ON signal is L level active; when PA508.0=1, S-ON signal is H level active.

- Confirmation of input signal level selections

The level selection of the input signal can be confirmed by the input signal monitoring (dP012).

- Multiple pins with same signal allocation

If same signal has been allocated to multiple I/O pins, the highest grade pin prevails. For example, DI 0 and DI 1 are both set to 0 (S-ON), then S-ON is only determined by DI 1 (highest grade pin).

## 2) Allocation of output signals

- Default allocations of output signals

PA	Description	Range	Unit	Default	Effective
PA510	<p><b>Output signal selection</b></p> <p><b>h.0001: DO 1 output signal selection</b></p> <p>[0] Alarm signal output (ALM)</p> <p>[1] Positioning completed (COIN): active when position pulse deviation is less than PA525.</p> <p>[2] Z pulse open-collector signal (CZ): can be negated by PA003.3 and expanded by PA201.3 &amp; PA210.</p> <p>[3] Brake release signal (BK): can be adjusted by PA518.</p> <p>[4] Servo ready signal (S-RDY): active when servo is in proper status.</p> <p>[5] Speed instruction reached (VCMP) / (torque threshold): active when speed deviation is less than PA517.</p> <p>[6] Motor rotation detection (TGON): active when rotational speed exceeds PA516.</p> <p>[7] Torque limited signal (TLC): active when load torque reaches PA402/PA403.</p> <p>[8] Zero-speed detection signal (ZSP): active when rotational speed is less than PA515.</p> <p>[9] Warning output (WARN)</p> <p>[A] Internal position control homing completion signal (HOME)</p> <p>[B] Internal position control position instruction completion signal (CMD-OK)</p> <p>[C] Internal position control positioning &amp; command completion signal (MC-OK)</p> <p>[D] Torque reached (TREACH): active when forward load torque exceeds PA404 or reverse load torque exceeds PA405.</p> <p><b>h.0010: DO 2 output signal selection</b></p> <p>same as DO 1</p> <p><b>h.0100: DO 3 output signal selection</b></p> <p>same as DO 1</p> <p><b>h.1000: DO 4 output signal selection</b></p> <p>same as DO 1</p>	h.0000 ~DDDD		<b>h.3210</b>	Immediate

<b>PA511</b>	<b>Output signal level selection (negation)</b> <b>b.0001: DO 1 (ALM) output signal level selection</b> [0] H level active (optocoupler not conductive) [1] L level active (optocoupler conductive)	b.0000 ~1111		b.0000	Immediate
	<b>b.0010: DO 2 output signal level selection</b> [0] L level active (optocoupler conductive)				
	[1] H level active (optocoupler not conductive)				
	<b>b.0100: DO 3 output signal level selection</b> [0] L level active (optocoupler conductive)				
	[1] H level active (optocoupler not conductive)				
	<b>b.1000: DO 4 output signal level selection</b> [0] L level active (optocoupler conductive)				
	[1] H level active (optocoupler not conductive)				

- Default signals and corresponding pins of DO 1 to DO 4

Parameter No.	Terminal name	CN2 pin	Default signal
PA510.0	DO1	7, 6	ALM
PA510.1	DO2	5, 4	COIN
PA510.2	DO3	3, 2	CZ
PA510.3	DO4	1, 26	BK

- Change level selection of output signals

If an output signal is not detected, then it is regarded as invalid. For example, COIN is invalid at speed control mode.

Typical output signal circuit is shown in the following diagram:

Take above figure as an example, COIN level is determined by PA510. When PA510=0, L level (conductive) is active; when PA510=1, H level (nonconductive) is active.

- Notes:

- ALM, WARN: active means alarm; inactive means no alarm.
- CZ level status cannot be modified by PA511;
- If same signal has been allocated to multiple I/O pins, the highest grade pin prevails. For example, DO 2 and DO 3 are both set to 2 (CZ), then CZ is only determined by DO 3 (highest grade pin).

### 3.4.4 Examples of connection with upper controllers

#### 1) Input signal connections

- Line driver, low speed pulse

- Line driver, high speed pulse (**maximum voltage: 5VDC**)

Compatible line driver: AM26LS31 (TI) or equivalent.

Connect the grounding of both controller & servo drive together in order to improve the anti-interference ability of the high speed pulse input interface.

- Open collector, option 1 (external 24VDC)

- Open collector, option 2 (external 5VDC, 12VDC or 24VDC)

Input current  $I = 10 \sim 15\text{mA}$ , thus R1 resistance:

If 24VDC,  $R1=2\text{K }\Omega$ ;

If 12VDC,  $R1=510\text{ }\Omega$ ;

If 5VDC,  $R1=180\text{ }\Omega$ ;

Normally, open collector pulses can be easily interfered. To reduce interference:

- Grounding: control line shielding shall connect to ground of upper controller power supply; on the drive side, the shielding shall hang in air;
- Modify PA201.0: the higher PA201.0, the higher filtering effect, the lower input chop frequency.

- Analog input

- Sequential control input

Connected by a relay or an open collector transistor circuit. When using relay connections, select the micro current relay. If you do not use small current relay, it will cause bad contact.

## 2) Output signal connections

- Sequential control output

ALM, S-RDY and other sequence of output signals are consisted of optocoupler. Please connect with relays.

Maximum DC voltage: 30VDC  
Maximum DC current: 50mA

- Line driver output

Encoder serial data are inverted into differential signals. Please use line receiver to process the output signals: PAO, /PAO; PBO, /PBO; PZO, /PZO.

- Analog output

Pin 44 (MON) & Pin 16 (SG) can be used to provide monitored analog data. For example, motor speed & current can be presented by analogy voltages. The servo drive provides one output channel for the user to monitor the data selected by PA021. This signal is referenced by GND and output voltage range is -8V~+8V.

## 3.5 Wirings of CN3 (feedback from encoder to servo drive)

### 3.5.1 Pin arrangement of CN3 connector

### 3.5.2 Examples of CN3 connections

#### ■ Line-saving incremental encoder

#### ■ 17-bit serial encoder

## 3.6 Standard wiring diagrams

### 3.6.1 Position control

### 3.6.2 Speed/torque control

# Chapter 4 Panel operations

## 4.1 Panel operator

Panel operator consists of a panel display and operating keys. Panel operator is used for displaying status, performing auxiliary functions, setting parameters and monitoring servo drive's movements. Hold & press ↑ & ← keys together can clear servo drive alarms. BUT please find out the cause of alarms first.

Key	Function description
MOD	Switch between different modes or cancel
←	Decimal point moves leftwards, in loops
↑	Increase or switches between + and -
SET	Equivalent to ENTER

## 4.2 Switch between different functions

## 4.3 Status code display

Status of servo drive is displayed by digits.

Bit data			
No.	Definition	Description in position control mode	Description in speed, torque control mode
(1)	Power supply ready	On when the main circuit power is ON; Off when the main circuit power is OFF.	On when the main circuit power is ON; Off when the main circuit power is OFF.
(2)	Compatibility	Positioning completed (COIN)	Speed instruction reached (VCMP)
(3)	Clear input signals	On when there is CLR input. Off when there is no CLR input.	On when there is CLR input. Off when there is no CLR input.
(4)	Position control mode	Light on	Light off
(5)	Rotation detection	When speed exceeds the set speed, the light is on (TGON)	When speed exceeds the set speed, the light is on (TGON)
(6)	Instruction input	Pulse input in progress	Speed/torque control in progress
(7)	Torque detection	Torque instruction exceeds the set value (20% of nominal torque).	Torque instruction exceeds the set value (20% of nominal torque).
(8)	Speed control mode	Light off	Light on if speed control is in progress.
(9)	Torque control mode	Light off	Light on if torque control is in progress.

Abbreviations			
10	Limit	 : left limit.  : right limit  &  alternately: left & right limits	 : left limit.  : right limit  &  alternately: left & right limits
11	Run	 : motor is excited.	 : motor is excited.

## 4.4 Monitoring display mode (dP □□)

At monitoring display mode, user can monitor the set values, I/O signal status and internal status of the servo drive.

### 4.4.1 Contents of monitoring display mode

Please refer to Chapter 5.1.

### 4.4.2 Example of operations at monitoring display mode (dP 00)

Step s	Panel display	Keys	Operations
1			Press MOD key to choose monitoring display function.
2			If the panel display is not dP 00, press UP & LEFT until it is dP 00.
3			Press SET to enter dP 00. This shows motor speed is 1600rpm.
4			Press SET or MOD to return to Step 1.
5	End of operations		

## 4.5 Parameter mode (PA □□□)

### 4.5.1 Remarks at parameter mode

#### ■ Storage setting status

After parameter editing, press SET to store the setting, and the panel display will constantly display the set state symbol for one second according to the setting state.

Panel display	Remarks
	Correct setting value, saved (Saved)
	Parameter effective after power off, then power on again (Reset)
	Wrong setting value or input data out of range (Out of Range)
	Parameter protected by cryptograph, cannot be modified (No operation)

#### ■ Data type

Panel display	Remarks
	Left-most digit is blank, meaning setting is on decimal base. When data is unsigned number, the setting range of left-most digit is 0~6, other digits are 0~9; When data is signed number, the left-most digit is the sign digit.
	The left-most digit is "b", meaning that the parameter setting is on a binary base. Scope for each digit is 0 ~ 1.
	The left-most digit is "d", meaning that the parameter setting is on a decimal base. Scope for each digit is 0 ~ 9.
	The left-most digit is "h", meaning that the parameter setting is on a hexadecimal base. Scope for each digit is 0 ~ F.

### 4.5.2 Example of operations at parameter mode (PA100)

Steps	Panel display	Keys	Operations
1	<b>PA000</b>		Press MOD to choose parameter mode.
2	<b>PA100</b>		If the panel display is not PA100, press ↑ & ← until it is PA100.
3	<b>PA 140</b>		Press SET to enter the parameter editing interface; it will show the left figure which means the current number is 40.
4	<b>PA 140</b>		Press “←” to make the digit 4 blink.
5	<b>PA 000</b>		Press “↑” for 6 times and the value becomes “00”.
6	<b>PA000</b>		Press “←” to move the digit, as shown in the left figure.
7	<b>PA200</b>		Press “↑” for 2 times and the value becomes “200”.
8	<b>SPEED</b>		Press SET to set the value of PA100 to 200. In this case, the value becomes effective immediately.
9	<b>PA100</b>		After about 1s, the display will return to the parameter editing interface.
10	<b>PA100</b>		Press MODE to exit
11	End of operations		

## 4.6 Auxiliary function mode (AF □□)

Auxiliary functions are used to perform some additional setting & tuning of the servo drive.

### 4.6.1 Contents of auxiliary function mode

Please refer to Chapter 6.1

### 4.6.2 Example of operations at auxiliary function mode (AF 05)

Steps	Panel display	Keys	Operations
1	<b>AF</b> <b>00</b>		Press MOD key to choose the auxiliary function.
2	<b>AF</b> <b>05</b>		Press “↑” or “←” to show “AF005”.
3	<b>P. In It</b>		If the servo is not running, press SET and the panel will display the left figure.
	<b>no - oP</b>		If the servo is running or the panel lock (AF 03) is set, the panel will display the left figure.
4	<b>- - - - -</b>		Press and hold “↑” to show the left figure.
5	<b>done</b>		Continue pressing it and the left figure means operation is completed.
6	<b>P. In It</b>		Relieve the key and the panel displays the left figure.
7	<b>AF</b> <b>05</b>		Press MOD or SET to exit from the auxiliary function and return to the display in step 2.
8	End of operations		

# Chapter 5 Monitoring display parameters

## 5.1 List of monitoring display parameters

No.	Function	Unit
dP 00	<b>Motor speed</b> Display the motor operating speed	[rpm]
dP 01	<b>Motor feedback pulse number (encoder unit, lower 4 digits)</b> Display the lower 4 digits of the sum of motor encoder feedback pulse.	[1 encoder pulse]
dP 02	<b>Motor feedback pulse number (encoder unit, higher 5 digits)</b> Display the higher 5 digits of the sum of motor encoder feedback pulse.	[ $10^4$ encoder pulses]
dP 03	<b>Input pulse number before electronic gear (user unit, lower 4 digits)</b> Lower 4 digits of the sum of input pulse number in position control mode.	[1 input pulse]
dP 04	<b>Input pulse number before electronic gear (user unit, higher 5 digits)</b> Higher 5 digits of the sum of input pulse number in position control mode.	[ $[10^4$ input pulses]]
dP 05	<b>Deviation pulse number (encoder unit, lower 4 digits)</b> Lower 4 digits of the sum of deviation pulse number in position control mode.	[1 encoder pulse]
dP 06	<b>Deviation pulse number (encoder unit, higher 5 digits)</b> Higher 5 digits of the sum of deviation pulse number in position control mode.	[ $10^4$ encoder pulses]
dP 07	<b>Speed instruction (analog voltage instruction)</b> Voltage value of analog input in speed control mode, after correction of null shift. When the voltage exceeds $\pm 10V$ , it cannot be displayed correctly.	[0.1V]
dP 08	<b>Internal speed instruction</b> Internal speed instruction under speed control and position control.	[r/min]
dP 09	<b>Torque instruction (analog voltage instruction)</b> Voltage value of analog input in torque control mode, after correction of null shift. When the voltage exceeds $\pm 10V$ , it cannot be displayed correctly.	[0.1V]
dP 10	<b>Internal torque instruction (value in relation to the rated torque)</b> Internal torque instruction in torque / speed / position control modes.	[%]

<b>dP 11</b>	<b>Torque feedback (value in relation to the rated torque)</b> Torque feedback value in torque / speed / position control modes.	[%]
<b>dP 12</b>	<b>Input signal monitoring</b> Input signal status of CN2 connector	-
<b>dP 13</b>	<b>Output signal monitoring</b> Output signal status of CN2 connector	-
<b>dP 14</b>	<b>Instruction pulse frequency</b> Instruction pulse frequency of the upper controller in position control.	[0.1Khz]
<b>dP 15</b>	<b>DC bus voltage</b> DC bus voltage after rectification	[V]
<b>dP 16</b>	<b>Total operation time of the servo drive</b> If AF05 operation is implemented, the value will be reset.	[Hours]
<b>dP 17</b>	<b>Rotation angle</b> Display the electric rotational angle of the motor.	[deg]
<b>dP 18</b>	<b>Exact position of absolute encoder (single-turn or multi-turn)</b> This displays the absolute position data of the encoder in one turn.	[2 Encoder pulse]
<b>dP 19</b>	<b>Number of encoder turns (only for multi-turn absolute encoders)</b> This displays the number of turns of multi-turn absolute encoder.	[1 turn]
<b>dP 20</b>	<b>Cumulative load factor (take rated cumulative load as 100%)</b> Alarm grade during motor overload protection.	[%]
<b>dP 21</b>	<b>Regeneration load factor (take rated regeneration load as 100%)</b> Alarm grade during regeneration overload protection	[%]
<b>dP 22</b>	<b>DB load factor (take rated DB load as 100%)</b> Alarm grade during DB braking protection	[%]
<b>dP 23</b>	<b>Load inertial ratio</b> Display the ratio between load inertia and motor inertia.	[%]
<b>dP 24</b>	<b>Effective gain monitoring</b> 1: the first group of gains is effective 2: the second group of gains is effective	-
<b>dP 30</b>	<b>Subsidiary software version (refer to AF 10 for main software version)</b>	-
<b>dP 34</b>	External linear encoder feedback pulse counts low place	[1 encoder pulse]
<b>dP 35</b>	External linear encoder feedback pulse counts high place	[ $10^4$ encoder pulses]
<b>dP 38</b>	Hybrid deviation low place	[1 encoder pulse]
<b>dP 39</b>	Hybrid deviation high place	[ $10^4$ encoder pulses]
<b>dP 40</b>	<b>Voltage class (refer to PA000.3 for voltage class setting)</b>	-
<b>dP 46</b>	<b>IGBT temperature</b>	°C

## 5.2 Input signal monitoring (dP 12)

### 5.2.1 Operations of entering dP 12

Steps	Panel display	Keys	Operations
1			Press MOD key to choose monitoring display function.
2			If the panel display is not dP 12, press ↑ & ← until it is dP 12.
3			Press SET to enter dP 12.
4			Press SET or MOD to exit to Step 1.
5		MOD ↑ SET	End of operations

### 5.2.2 Explanations of dP 12 LED displays

Input signal status are shown by the LED displays.

Upper: corresponding signal status  
Lower: level of corresponding signal  
DI number

- Corresponding signal status
  - LED off: signal is inactive
  - LED on: signal is active
- Level of corresponding signal
  - LED off: high level (non-conductive)
  - LED on: low level (conductive)

DI number	Pin (CN2)	Default signal
1	9	S-ON
2	10	C-MOD
3	34	POT
4	8	NOT
5	33	CLR
6	32	A-RESTART
7	31	INHIBIT
8	30	ZEROSPD

- Even without external signal inputs, by modifying PA 508 & PA509, user can still make corresponding signal active.

### 5.2.3 Examples of dP 12 LED displays

- PA508.0=0: S-ON is active, DI 1 is low level and low level is active.

- PA508.0=1: S-ON is inactive; DI 1 is low level and high level is active.

- PA508.0=1, S-ON is active; DI 1 is high level and high level is active.

## 5.3 Output signal monitoring (dP 13)

### 5.3.1 Operations of entering dP 13

Step s	Panel display	Keys	Operations
1			Press MOD key to choose monitoring display function.
2			If the panel display is not dP 13, press ↑ & ← until it is dP 13.
3			Press SET to enter dP 13.
4			Press SET or MOD to exit to Step 1.
5			End of operations

### 5.3.2 Explanations of dP 13 LED displays

Output signal status are shown by the LED displays.

Upper: corresponding signal status  
Lower: level of corresponding signal

DO number

- Corresponding signal status
    - LED off: signal is inactive
    - LED on: signal is active
  - Level of corresponding signal
    - LED off: high level (non-conductive)
    - LED on: low level (conductive)
- | DO number | Pin (CN2) | Default signal |
|-----------|-----------|----------------|
| 1         | 7, 6      | ALM            |
| 2         | 5, 4      | COIN           |
| 3         | 3, 2      | CZ             |
| 4         | 1, 26     | BK             |
- Even output signal is inactive, by modifying PA 511, user can still make corresponding signal active.
  - dP13 is always off if the output signal is CZ.

### 5.3.3 Examples of dP 13 LED displays

- PA511.0=0: ALM is inactive; DO 1 is low level.

- PA511.0=0: ALM is active; DO 1 is high level.

- PA511.0=1: ALM is active; DO 1 is low level.

### 5.4 Initial monitoring display at power on

- If PA014 is not 50, then user can set which monitoring display parameter to display at power on.
- If PA014=50 (default), then status codes will be displayed at power on (refer to chapter 4.3)

### 5.5 Display range of dP 01~dP 06

- Display range of dP 01, dP 03 and dP 05 is [-32767, 32767].  
A left-most decimal point is used for displaying -32767.

Number is negative.

- When the absolute value of motor feedback pulse number ( $dP\ 02*10^4+dP\ 01$ ), input pulse number before electronic gear ( $dP\ 04*10^4+dP\ 03$ ) and deviation pulse number ( $dP\ 06*10^4+dP\ 05$ ) exceeds 327679999, the monitoring display will not be updated.

# Chapter 6 Auxiliary functions

## 6.1 List of auxiliary function parameters

No.	Function	Reference
<b>AF 00</b>	Display of alarm logging	6.2
<b>AF 01</b>	Position assignment (only active in position control mode)	6.3
<b>AF 02</b>	JOG run	6.4
<b>AF 03</b>	Panel lock	6.5
<b>AF 04</b>	Clearance of alarm logging	6.6
<b>AF 05</b>	Parameter initialization	6.7
<b>AF 06</b>	Analog instruction (speed & torque) automatic offset adjustment	6.8
<b>AF 07</b>	Speed instruction manual offset adjustment	6.9
<b>AF 08</b>	Torque instruction manual offset adjustment	6.10
<b>AF 09</b>	Overview of relevant motor parameters	6.11
<b>AF 10</b>	Display of main software version of servo drive	6.12
<b>AF 11</b>	Setting up absolute encoders	6.13
<b>AF 12</b>	Clearance of error logging for absolute encoders	6.13
<b>AF 15</b>	Manual detection of load inertia	6.14

## 6.2 Display of error logging (AF 00)

Up to 10 most recent alarms can be displayed.

Steps	Panel display	Keys	Operations
1	<b>AF</b> <b>00</b>		Press MOD key to choose auxiliary function mode.
2	<b>AF</b> <b>00</b>		If the panel display is not AF 00, press ↑ & ← until it is AF 00.
3	<b>EI</b> <b>03</b>		Press SET to enter AF 00.
4	<b>EI</b> <b>21</b> ↑                  ↓ Alarm sequence      Alarm code		Press “←” once and it will display one previous alarm. Press “↑” once and it will display a new alarm. The bigger the number on the left side, the older the alarm displayed.
5	<b>AF</b> <b>00</b>		Press SET to exit to Step 2.
6	End of operations.		

Notes:

- When there have been no alarms, the alarm No. is 0.
- The alarm logging can be deleted through Clearance of Alarm Logging (AF 04).
- A-RESTART or power off cannot clear the alarm loggings.

## 6.3 Position assignment (AF 01)

With this function, motor feedback position & instruction pulse position is assigned by value of PA766 & PA767.

This parameter will also reset the values in dP 01 ~ dP06.

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 01, press ↑ & ← until it is AF 01.
3			Press SET to enter AF 01.
4			Press and hold ↑.
5			
6			Release the key.
7			Press MOD or SET to exit to Step 2.
8	End of operations.		

## 6.4 JOG run (AF 02)

JOG run is the function to confirm the servo motor action through speed control without connecting to the upper controller. During JOG run, the overtravel prevention function (POT, NOT) is inactive. **User shall pay close attention to mechanical movement of the machinery caused by JOG run.**

### 1) Preparing for JOG run

Before JOG run, the following settings are necessary.

- When S-ON input signal is ON, please switch it to OFF.
- Please set the JOG speed after considering mechanical movement of the machinery. **JOG speed can be set by PA306.**
- Please take necessary safety measures and ensure it can stop at any emergency.
- In order to ensure safety, a stop device shall be set on the machine side.

### 2) JOG run procedures

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 02, press ↑ & ← until it is AF 02.
3			Press SET to enter AF 02.
4			<i>This will show if the servo is running or panel is locked (AF 03).</i>
5			Press MOD to enable the servo.
6			Press ← to JOG forward or ↑ to JOG reversely.
7			Press MOD (or SET) to stop enabling the servo.
8			Press SET to exit to Step 2.
9	End of operations.		

## 6.5 Panel lock (AF 03)

Password settings:

- When it is set to be 58, no parameters or functions can be operated.
- When it is set to be 315, all parameters and functions (even hidden) can be operated.
- When it is set to be any other value, only the parameters and functions listed in the user manual can be operated.

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 03, press ↑ & ← until it is AF 03.
3			Press SET.
4			Press SET to enter AF 03
5			Press ↑ or ← to set the password.
6			Press SET to finish password setting and exit to Step 2.
7	End of operations.		

## 6.6 Clearance of alarm logging (AF 04)

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 04, press ↑ & ← until it is AF 04.
3			Press SET.
4			Press and hold ↑.
5			This shows the operation is done.
6			Release the key.
7			Press MOD or SET to exit to Step 2.
8	End of operations.		

## 6.7 Parameter initialization (AF 05)

To achieve parameter initialization, servo must not be ON. Also, restart afterwards to make initialization effective.

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 05, press ↑ & ← until it is AF 05.
3			Press SET if the servo is not ON.
4			<i>This will show if the servo is running or panel is locked (AF 03).</i>
5			Press and hold ↑.
6			This shows the operation is done.
7			Release the key.
8			Press MOD or SET to exit to Step 2.
9	Power off, then power on again.		
10	End of operations.		

## 6.8 Analog instruction automatic offset adjustment (AF 06)

This is a method for self-regulation of the instruction voltage (speed instruction and torque instruction) after measuring the offset. The measured offset will be saved in the servo drive.

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 06, press ↑ & ← until it is AF 06.
3			Press SET.
4			Press and hold ↑.
5			This shows the operation is done.
6			Release the key.
7			Press MOD or SET to exit to Step 2.
8	End of operations.		

## 6.9 Speed instruction manual offset adjustment (AF 07)

This is the method to input the speed instruction offset directly for regulation.

Steps	Panel display	Keys	Operations
1	<b>AF 00</b>		Press MOD key to choose auxiliary function mode.
2	<b>AF 07</b>		If the panel display is not AF 07, press ↑ & ← until it is AF 07.
3	<b>- . SPd</b>		Press SET.
4	<b>- . SPd</b>		This will show if the servo is ON.
5	<b>103</b>		Press SET to display current offset value.
6	<b>108</b>		Press ↑ or ← for adjustment.
7	<b>SAVED</b>		Press SET, ‘SAVED’ will show and blink, then will exit to Step 2.
8	<b>AF 07</b>		Press MOD to exit to Step 2 without saving.
9	End of operations.		

## 6.10 Torque instruction manual offset adjustment (AF 08)

This is the method to input the torque instruction offset directly for regulation.

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 08, press ↑ & ← until it is AF 08.
3			Press SET.
4			This will show if the servo is ON.
5			Press SET to display current offset value.
6			Press ↑ or ← for adjustment.
7			Press SET, 'SAVED' will show and blink, then will exit to Step 2.
8			Press MOD to exit to Step 2 without saving.
9	End of operations.		

## 6.11 Overview of relevant motor parameters (AF 09)

Display the model, encoder type and motor phase of the servo motor connected to the servo drive. If the servo drive has special specifications, its serial number will also be displayed.

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 09, press ↑ & ← until it is AF 09.
3			Press SET to show the left figure. It means the drive model is 0, and the first letter is identified as "d".
4			Press "↑" to show the motor model, and the first letter is identified as "F".
5			Press "↑" to show the model of encoder. <ul style="list-style-type: none"><li>▪ 0: multi-turn absolute encoder;</li><li>▪ 1: single-turn absolute encoder;</li><li>▪ 2: line-saving incremental encoder.</li></ul> The first letter is identified as "E".
6			Press SET to exit to Step 2.
7	End of operations.		

## 6.12 Display of main software version of servo drive (AF 10)

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 10, press ↑ & ← until it is AF 10.
3			Press SET. ‘d 1.00’: DSP software version is 1.00.
4			Press ↑. F 1.03: FPGA software version is 1.03.
5			Press MOD or SET to exit to Step 2.
6	End of operations.		

## 6.13 Setting up absolute encoders (AF 11)

This function is used under the following conditions:

- Absolute encoder is used for the first time;
- There are alarms related to absolute encoders;
- User intends to set quantity of turns of a multi-turn encoder to 0.

Notes:

- Servo must be OFF;
- A-RST cannot clear alarms related to absolute encoders;
- Power off and power on again after setting;
- This operation will set quantity of turns of a multi-turn encoder to 0 and clear all alarms related to absolute encoders

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 11, press ↑ & ← until it is AF 11.
3			Press SET.
4			Press and hold ↑.
5			This shows the operation is done.
6			Press MOD or SET to exit to Step 2.
7	Power off and power on again.		
8	End of operations.		

## 6.14 Manual detection of load inertia (AF 15)

Overtravel prevention is inactive during the process of manual detection of load inertia.

### Preparations before operation

- Servo is OFF;
- Please set PA300.2 for running distance of the motor in this operation, after careful study of all related mechanical parts.
- Please take necessary safety measures, e.g. a stop device on the machine side, for emergency stops.

Steps	Panel display	Keys	Operations
1			Press MOD key to choose auxiliary function mode.
2			If the panel display is not AF 15, press ↑ & ← until it is AF 15.
3			Press SET.
4			<i>This will show if the servo is running or panel is locked (AF 03).</i>
5			Press MOD to run manual detection of load inertia.
6			During operation, press SET for emergency stop.
7			Load inertia will display after operation, unit: Kg*cm <sup>2</sup>
8			Press MOD or SET to exit to Step 2.
9			End of operations.

# Chapter 7 JOG run

## 7.1 Preparations before JOG run

Please check the following items before JOG run:

Item	What to check
Servo motor	Whether the motor has been released from load?
	Whether the wiring and connection are correct?
	Whether the fastening parts are loose?
	If the servo motor has a holding brake, whether the brake has been released (by separate 24VDC) in advance?
Servo driver	Whether the wirings and connections are correct?
	Whether the input voltage to the servo drive is stable?

## 7.2 JOG run by panel operations

Please refer to Chapter 6.4

## 7.3 Stand-alone JOG run with upper controllers

Please check the following items before JOG run by instructions from upper controllers:

Item	What to check
1	Whether I/O signals are correctly set?
2	Whether the connections between upper controller and servo drive is correct and whether the polarities are set correctly?
3	Whether the instructions are correctly set?

### 7.3.1 Wiring & status check of input signal circuit

Steps	Operations	Reference
1	Please make sure following signals are connected to CN2: ▪ S-ON ▪ POT & NOT	3.3
2	Connect servo drive to upper controller.	-
3	Power on. Check status of dP 12.	4.3
4	Input S-ON to enable the servo.	4.3
5	End of preparations for JOG run.	-

### 7.3.2 JOG run in position control mode

Steps	Operations	Reference
1	Reconfirm the power supply and input signal circuit and then switch on the control power supply of servo drive.	3.1
2	Use PA200.0 to set the input pulse form.	8.4.1
3	Use PA205 and PA206 to set the electronic gear ratio; Use PA210 to set encoder divided frequency pulse number.	8.4.2 8.5.7
4	Power on again.	-
5	Input S-ON to enable the servo.	-
6	Output low speed pulse instruction from the upper controller with easily confirmed motor rotation (such as: 1 turn).	-
7	Monitor the input pulse number (dP 03 & dP 04).	5.1
8	Monitor feedback pulse number (dP 01 and dP 02).	5.1
9	Confirm whether the servo motor rotates in the direction given by the instruction.	-
10	Check whether the number of feedback pulse corresponds with the expected number. <b>Feedback pulse number = (dP 01*10<sup>4</sup>+dP 02) *PA210*4/ encoder resolution</b>	5.1
11	Stop the pulse instruction and make the servo OFF.	-

### 7.3.3 JOG run in speed control mode

Steps	Operations	Reference
1	Reconfirm the power supply and input signal circuit and then switch on the control power supply of servo drive.	3.1
2	Adjust speed instruction input gain by PA301.	8.5
3	Power on.	-
4	Confirm the speed instruction input (voltage between V- REF and AGND) is 0 V, and then switch on the servo ON (S-ON) input signal.	-
5	Increase speed instruction input voltage (voltage between V-REF and AGND) from 0V slowly.	-
6	Confirm the speed instruction value (voltage) through the speed instruction monitoring (dP 07).	5.1
7	Confirm the motor speed (rotating speed) through motor speed monitoring (dP 00).	5.1
8	Confirm the values in procedures 6 and 7 (dP07 and dP00) are consistent according to the conversion relation.	5.1
9	Confirm whether the servo motor rotates in the direction given by the instruction.	-
10	Return speed instruction input to 0V, and make the servo OFF. Then the speed test run is finished.	-

## 7.4 JOG run with mechanical connections

After stand-alone JOG run, user can then proceed to JOG run with mechanical connections.

Steps	Items	Operations	Reference chapter
1	Parameter setting 1	Power on and conduct the setting related to the safety functions, overtravel and brake protection functions.	3.1 8.2
2	Parameter setting 2	Set the necessary parameters according to the control mode used.	-
3	Installation	Power OFF and connect the servo motor with the mechanical parts.	-
4	Check	Power on upper controller but keep the servo OFF, and then confirm whether the protection functions set in Step 1 function normally.	-
5	Operation	Conduct JOG run same way as Chapter 7.3. Confirm the JOG run result is up to expectations with mechanical connections.	7.3
6	Adjustment	Adjust the servo gains (if necessary) to improve the response characteristic of servo motor.  During the JOG run, the servo motor may not adapt to the machine well at the beginning. Please conduct fine tune to make them adapt to each other.	-
7	Finish	Then, the JOG run is finished.	-

## 7.5 JOG run with a holding brake

Item	Remarks
1	When conducting JOG run of the servo motor with a brake, before confirming the action of brake, measures to prevent the natural fall or vibration due to external force of the machine shall be taken.
2	When conducting the JOG run of servo motor with a brake, please first of all confirm the action of servo motor and holding brake before connecting the servo motor with the machine. If there are no problems, conduct the JOG run again by connecting the servo motor with the machine.
3	Please control the action of the holding brake BK signal.

# Chapter 8 Servo operations

## 8.1 Control mode selections

Parameter	Control mode	Reference
PA000.1	<b>Position control (pulse train instruction)</b> The position of servo motor is controlled through the pulse train position instruction. The position is controlled through the pulse number inputted, and speed is controlled through the frequency of input pulse. It is used when the action needs to be positioned.	8.4
h.□□0□	<b>Speed control (analog voltage instruction)</b> Use this under the following occasions: <ul style="list-style-type: none"><li>▪ To control the rotating speed;</li><li>▪ Use the encoder pulse output of servo drive and establish the position loop through the upper controller for position control.</li></ul>	8.5
h.□□1□	<b>Torque control (analog voltage instruction)</b> Use the analog voltage torque instruction to control the output torque of servo motor.	8.6
h.□□2□	<b>Internal speed control</b> Use 3 input signals, INSPD0, INSPD1 and INSPD2, for speed control through the 8 preset speeds in the servo drive. When this control mode is used, the analog instruction is not needed.	8.7
h.□□3□	<b>Internal speed control ↔ Position control</b>	8.10
h.□□4□	<b>Internal speed control ↔ Speed control</b>	8.10
h.□□5□	<b>Internal speed control ↔ Torque control</b>	8.10
h.□□6□	<b>Position control ↔ Speed control</b>	8.10
h.□□7□	<b>Position control ↔ Torque control</b>	8.10
h.□□8□	<b>Torque control ↔ Speed control</b>	8.10
h.□□9□	<b>Internal position control</b> System positions will be controlled without the upper controller.	8.8
h.□□A□	<b>Internal position control ↔ Position control</b>	8.10
h.□□B□	<b>Reserved</b>	
h.□□C□	<b>Fully closed loop control</b>	8.11
h.□□D□		

## 8.2 Basic function settings

### 8.2.1 S-ON settings

- S-ON is the instruction for servo motor on/off

Type	Signal	Status	Level	Remarks
Input	S-ON	ON	2CN-9: Low	Servo is ON & ready for operations.
		OFF	2CN-9: High	Servo is OFF.

- Selection of S-ON level

Parameter		Remarks
PA508	b.□□□0	L level active (optocoupler conductive) (default)
	b.□□□1	H level active (optocoupler not conductive)

## 8.2.2 Switch of motor rotational directions

The servo drive can enable the servo motor to rotate reversely (negative rotation mode) without changing the wiring of servo motor.

The positive direction is counter clockwise rotation (CCW). Negative mode only changes the rotational direction of the motor and positive direction becomes clockwise rotation (CW), and **encoder pulse output polarity remains unchanged**.

Parameter	Instructions & rotational directions	Overtravel (OT)
h.□□0	<ul style="list-style-type: none"> <li>■ Rotational direction at positive instruction</li> </ul> 	POT
	<ul style="list-style-type: none"> <li>■ Rotational direction at negative instruction</li> </ul> 	NOT
PA000	<ul style="list-style-type: none"> <li>■ Rotational direction at positive instruction</li> </ul> 	NOT
	<ul style="list-style-type: none"> <li>■ Rotational direction at negative instruction</li> </ul> 	POT

### 8.2.3 Overtravel (OT) settings

Overtravel refers to the safety function which can make the limit switch function (ON) and force the servo motor to stop when the moving parts of a machine go beyond the movable area.

Attention				
<b>Installation of limit switches</b>				
Limit switches must be installed in applications such as linear motions. When the limit switch has bad contacts or broken wires, please use ‘normally closed nods’ to ensure the motor moves to the safer side.				
<b>Use of servo motors in vertical axis</b>				
Work piece might fall when overtravel. To prevent this, please set the servo into zero-speed clamp when overtravel.				

#### (1) Wiring for overtravel

Type	Signal	Pin	Setting	Meaning
Input	POT	CN2-34 (default)	ON=L level	Can forward run
			OFF=H level	Forward run prohibited (positive overtravel)
Input	NOT	CN2-8 (default)	ON=L level	Can reverse run
			OFF=H level	Reverse run prohibited (negative overtravel)

When in overtravel, servo can still move in the opposite direction.

#### Important

- There might be position deviation pulse residual at overtravel in position control. To clear the residual, use CLR signal.
- POT, NOT can be allocated to other Pins.
- To use POT, NOT, please set PA003.0 & PA003.1 to 0.

## (2) Selection of servo stop patterns at overtravel

Parameter	During stop	After stop	Meaning
PA001	d.□□0□ d.□□□0	DB to stop	DB state DB to stop and maintain DB state after stop.
	d.□□0□ d.□□□1		DB to stop and enter free state (power off) after stop.
	d.□□0□ d.□□□2	Coast to stop	Coast to stop and enter free state (power off) after stop.
	d.□□1□		Zero-speed clamp state Use emergency stop torque (PA406) to decelerate and enter zero-speed clamp state after stop.
	d.□□2□	Decelerate to stop	Free state Use emergency stop torque (PA406) to decelerate and enter free state (power off) after stop.

- Please restart the servo drive after modifying this parameter.
- If the servo receives S-ON signal during coast to stop, the servo motor can only be controlled after the speed has decelerated to 0.
- Definitions:
  - DB: dynamic brake (internal short-circuit of servo drive). This feature is optional.
  - Coast to stop: stop using natural frictions.
  - Zero-speed clamp: the state when position instruction is 0 and position deviation is cleared.

## (3) Enable overtravel signal

Parameter	Description	
PA003	b.□□□ 0	Forward rotation prohibited (POT) valid
	b.□□□ 1	Forward rotation prohibited (POT) invalid (default)
	b. □□ 0 □	Reverse rotation prohibited (NOT) valid
	b.□□ 1 □	Reverse rotation prohibited (NOT) invalid (default)

## (4) Stop torque setting during overtravel

PA406	Emergency Stop Torque			
	Range	Unit	Default	Effective
	0 ~ 300	1%	300	Immediately
<ul style="list-style-type: none"> <li>• Set the torque for motor stop when the overtravel signals (POT, NOT) are valid.</li> <li>• The setting unit is the % of the rated torque. (the rated torque is 100%)</li> <li>• When the emergency stop torque exceeds the maximum running torque of the motor, the actual emergency stop torque output is the motor's maximum running torque; When the emergency stop torque is too small, there may be E.28 alarm during deceleration.</li> </ul>				

## 8.2.4 Holding brake settings

The holding brake is often used when the motor is used in the vertical axis. When the power of servo drive is OFF, the servo motor with a brake can keep the moving parts from moving due to gravity. (Please refer to Chapter 7.5 JOG run with a holding brake)

- The holding brake can only be used to maintain the halt state, not braking, of the servo motor. The brake torque is 70% or above of the rated torque of servo motor.
- If only the speed loop is used to activate the servo motor, when the brake functions, set the servo OFF and input instruction to be "0V".
- When setting the position loop, because the servo motor is under servo locked state at stop, the mechanical brake shall not function.

### (1) Example of connection

The sequential output signal of servo drive (BK) and brake power supply forms the ON/OFF of the brake. Standard connection of a circuit is illustrated as follows.

The brake has delay action time; please refer to the figure below for the order of ON and OFF of the action.

\*1. The time from BK signal active to brake release is different for different types of brakes  
 \*2. PA518 value

## (2) BK signal output

Type	Signal name	Pin	Setting	Meaning
Output	BK	Need allocation	ON=L level	Brake release
			ON=H level	Brake holding

Use of the servo motor with a brake needs to control the output signal of brake. In addition, the output signal is not available in factory default setting. Therefore, it is necessary to allocate the output signal (setting of PA510). Do not connect with it when the motor without a brake is used.

### ■ Important

When overtravel, even the servo motor is powered off, no BK signal can output.

## (3) Allocation of BK signal

Brake signal (BK) is allocated to DO4 (CN2-25, CN2-26) by default, but can also be allocated freely.

Parameter	Pin		Meaning
	+	-	
PA510	h.□□3□	CN2-4	BK signal output from CN2-4, CN2-5
	h.□3□□	CN2-3	BK signal output from CN2-3, CN2-2
	h.3□□□	CN2-1	BK signal output from CN2-1, CN2-26

Please refer to Chapter 3.4.3 ‘Allocation of I/O signals’

#### (4) BK signal hysteresis time after Servo-OFF

BK signal is normally OFF when servo OFF, but users can change the BK signal hysteresis time after Servo-OFF.

PA518	BK signal hysteresis time after Servo-OFF			
	Range	Unit	Default	Effective
	0~500	ms	100	Immed

When used on a vertical axis, moving parts of the machine sometimes may move slightly due to deadweight or external force. The slight movement may be eliminated by using the user parameter to delay the actions after the servo OFF.

When an alarm is given out, the servo motor will be immediately powered off, and the setting of this parameter becomes irrelevant.

Owing to the deadweight of machine moving parts or the external force, the machine sometimes may move before the brake functions

#### (5) Setting of BK signal timing during the rotation of servo motor

When a halt instruction is given to the rotating servo motor during servo OFF or an alarm, the output conditions of BK signal can be changed according to the following user parameters.

PA519	BK signal speed limit			
	Range	Unit	Default	Effective
	0~1000	rpm	100	Immed
BK signal waiting time at Servo-OFF				
PA520	Range	Unit	Default	Effective
	100~1000	1ms	500	Immed

---

**BK signal will be OFF (H level, nonconductive) in following situations:**

- The motor speed is below PA519 after servo OFF
- The waiting time exceeds PA520 after servo OFF

---

Even PA519 is set to be above the maximum speed of the servo motor, the servo motor will be restricted by its own maximum speed.

---

### 8.2.5 Selection of servo stop patterns at servo OFF

Parameter		During stop	After stop	Meaning
PA001	d.□□□0	DB to stop	DB state	DB to stop and maintain DB state after stop.
	d.□□□1		Free state	DB to stop and enter free state (power off) after stop.
	d.□□□2	Coast to stop	Free state	Coast to stop and enter free state (power off) after stop.
	d.□□□3	Decelerate to stop	DB state	Decelerate at rate of PA522, & stay in DB state when speed is lower than PA523.
	d.□□□4		Free state	Decelerate at rate of PA522, & coast to stop when speed is lower than PA523.

- This parameter is valid in following situations:
  - When S-ON signal is OFF;
  - When there is an alarm output;
  - When main power (L1, L2, L3) is off.
- In the above setting "DB state maintenance after DB stops" of "d.□□□0", if the servo motor stops or rotates at a very low speed, no brake force will be generated.
- Definitions:
  - DB: dynamic brake (internal short-circuit of servo drive). This feature is optional.
  - Coast to stop: stop using natural frictions.

---

Dynamic brake (DB) can be used for emergency stop.

When the servo motor is frequently started and stopped through the power ON/OFF or servo ON signal (S-ON), DB circuit will also repeat ON and OFF frequently, which is the main cause for the aging of the interior components of the servo drive. Please start and stop the servo motor through the speed input instruction and position control instruction.

## 8.2.6 Instantaneous power off settings

This is to set when the main power supply is OFF instantly, whether the motor shall go on operating or set to be servo OFF

PA521	Instantaneous power off holding time			
	Range	Unit	Default	Effective
	40~800	1ms	60	Immed

If the OFF→ON resetting time is below the setting value of this parameter, the servo will keep on operating.

But under the following circumstances, the setting of this parameter will not become effective:

- The load of servo motor is too big, which causes "under voltage warning (A.96)" during instantaneous power off;
- When the control power supply is out of control (the same to the usual power OFF operation) during the period of instantaneous power off.

The maximum holding time setting value is 800ms during instantaneous power off, but the holding time of control power supply of the servo motor is about 200ms. The holding time of main power supply varies along with the output of servo drive.

Please use a UPS in order to go on controlling the servo drive if instantaneous power off time is beyond the maximum setting value of this parameter.

### 8.2.7 Analog voltage output

Pin 44 (MON) & Pin 16 (SG) of CN2 provide analog data for monitoring. For example, motor running status. Motor speed and current can also be demonstrated by analog voltage. The range for analog voltage is -8V~+8V.

Parameter		Meaning
PA021	d.□□□	Analog output is motor speed feedback. (default)
	d.□□□1	Analog output is motor torque feedback.
	d.□□0□	Output voltage is not negated. (default)
	d.□□1□	Output voltage is negated.

PA023	Analog voltage output gain			
	Range	Unit	Default	Effective
	0~65535		0	Immed

The corresponding relations are as below:

PA023	Analog output data: speed	When PA023≠0:
0	500rpm = 1V, -1000rpm = -2V	Output voltage = $\frac{\text{motor speed}}{\text{PA023}}$
500	500rpm = 1V	
1000	1000rpm = 1V	
250	500rpm = 2V	

PA023	Analog output data: torque	When PA023≠0:
0	100% torque = 3V, -100% torque = -3V	Output voltage = $\frac{\text{torque} \times 1000}{\text{PA023}}$
333	100% torque = 3V, -100% torque = -3V	
222	100% torque = 4.5V, -50% torque = -2.25V	
666	100% torque = 1.5V, -200% torque = -3V	

PA024	Analog voltage output zero calibration			
	Range	Unit	Default	Effective
	-8000~8000	mV	0	Immed

## 8.3 Using absolute encoders

If the servo motor with an absolute encoder is used, an absolute value detection system can be set in the instruction control unit. Thus after power on again, the motor can directly run without zero reset.

Encoder type	Resolution	Data output range	Action when exceed the limit
Absolute encoder with multi-turn memory	17-bit	-32768 ~+32767	<ul style="list-style-type: none"><li>When going beyond the upper limit (+32767) of positive rotation direction, the multi-turn data become -32768.</li><li>When going beyond the lower limit (-32768) of reverse rotation direction, the multi-turn data become +32767.</li></ul>

When multi-turn data overflows, E.58 will output. PA007.1 can disable this alarm

Parameter	Meaning	
PA007	d.□□0□	Multi-turn data overflows will output E.58 (default).
	d.□□1□	Multi-turn data overflows will not output E.58

### 8.3.1 Absolute encoder selection

Parameter	Meaning	
PA002	d.□0□□	Use absolute encoders as incremental encoders. (default)
	d.□1□□	Use absolute encoders as absolute encoders. <ul style="list-style-type: none"><li>When use absolute encoders as incremental encoders, no battery is needed.</li><li>After modifying this parameter, restart the servo to take effect.</li></ul>

### 8.3.2 Using battery for absolute encoder

Even the power is OFF, a battery is needed to back up data, so that the absolute encoder can save the position information.

#### (1) Battery selection

Please make preparations according to the specification of instruction control unit; the battery shall be the product equivalent to ER3V (3.6V, 1000mA TOSHIBA battery).

#### (2) Battery installation

The battery shall be mounted inside the battery case of the encoder cable; pay close attention not to reverse the polarities.

### **8.3.3 Battery replacement**

When the battery voltage drops to be below 3.1V, the servo drive will output "17-bit serial encoder battery warning (A.97)". But this warning only output when the servo drive is ON. If the battery voltage is ultralow when the servo drive is powered on, the servo drive will not give any warning. User can modify warning for ultralow battery voltage.

- **Procedures to replace the battery**

1. Please replace the battery when the control power of servo drive is ON.
2. After replacing the battery, please make the servo drive power OFF, so as to clear "17-bit serial encoder battery warning (A.97)".
3. Restart the power of servo drive; if there is no abnormal action, the battery is successfully replaced.

#### **Important**

When the control power supply of servo drive is OFF and the battery connection has been moved (so has the encoder line), data inside the absolute value encoder will be lost. Therefore, setting of absolute value encoder is necessary. Please refer to Chapter 6.13 Setting up absolute encoders (AF 11).

### **8.3.4 Setting up absolute encoders (AF 11)**

Please refer to Chapter 6.13 Setting up absolute encoders (AF 11).

This function is used under the following conditions:

- Absolute encoder is used for the first time;
- There are alarms related to absolute encoders;
- User intends to set quantity of turns of a multi-turn encoder to 0.

Notes:

- Servo must be OFF;
- A-RST cannot clear alarms related to absolute encoders;
- Power off and power on again after setting;
- This operation will set quantity of turns of a multi-turn encoder to 0 and clear all alarms related to absolute encoders

**After AF 11 is done, please restart the servo drive.**

## 8.4 Position control operations

### 8.4.1 Parameter settings

When using pulses for position control, please pay attention to following parameters.

#### 1) Control mode selection

Parameter		Meaning
PA000	h.□□0□	Position control (pulse train)

#### 2) Pulse form selection

Type		Signal	CN2 Pin
Input	Low speed channel (<500 Kbps)	PULS+	43
		PULS-	41
		SIGN+	39
		SIGN-	37
	High speed channel (<4 Mbps)	HPULS+	38
		HPULS-	36
		HSIGN+	42
		HSING-	40

Parameter		Pulse form	Forward rotation	Reverse rotation
PA200	d.□□00	PULS+ SIGN	PULS (CN2-7/8)  SIGN (CN2-11/12) 	PULS (CN2-7/8)  SIGN (CN2-11/12) 
		CW+ CCW	PULS (CN2-7/8)  SIGN (CN2-11/12) 	PULS (CN2-7/8)  SIGN (CN2-11/12) 
			PULS (CN2-7/8)  SIGN (CN2-11/12) 	PULS (CN2-7/8)  SIGN (CN2-11/12) 
	d.□□02	A phase + B phase	PULS (CN2-7/8)  SIGN (CN2-11/12) 	PULS (CN1-7/8)  SIGN (CN1-11/12) 
			PULS (CN2-7/8)  SIGN (CN2-11/12) 	PULS (CN1-7/8)  SIGN (CN1-11/12) 

### 3) Position deviation clearance

Besides CLR signal, a timed position deviation clearance can be selected by parameter PA200.2.

Parameter		Meaning
PA200	d.0□□□	Clear position deviation when S-ON is off, power is off or by CLR signal.
	d.1□□□	Clear position deviation only by CLR signal.
	d.2□□□	Clear position deviation only when servo has alarm or by CLR signal.

### 4) Input pulse channel selection

User can select input pulse channel by PA200.3.

Parameter		Meaning
PA200	d.0□□□	<b>PULS+SIGN input: low speed pulse channel</b> Pulse input in this channel is received by optocoupler. It is suitable for upper controller of collector output and long-line transmitter output, frequency $\leq 500K$ bps.
	d.1□□□	<b>HPULS+HSIGN input: high speed pulse channel</b> Pulse input in this channel is received by long-line receiver. It is suitable for upper controller of long-line transmitter output, frequency $\leq 4M$ bps.

## 8.4.2 Electronic gear

### 1) Encoder resolutions

Parameter		Encoder type	Pulses per revolution	Resolution
PA002	d.0□□□	Absolute encoder	32768	131072 (17-bit)
	d.1□□□	Incremental encoder	32768	131072 (17-bit)
	d.2□□□	Incremental encoder	5000	20000
	d.7□□□	Resolver	4096	16384 (15-bit)
	d.8□□□	Incremental encoder	262144	1048576 (20-bit)

Remarks: encoder resolution is 4 times (quadruple frequency) of encoder pulses per revolution.

### 2) Electronic gear ratio

The function of electronic gear is for setting the work-piece moving distance by 1 pulse instruction (1 instruction unit).

### 8.4.3 Position instructions

Upper controller's output forms include the following:

- Field-bus output
- +24V open-collector output
- +12V open-collector output
- +5V open-collector output

Open-collector output signals can only connect to servo drive's CN2-43, 41, 39, 37, and the parameter should be set to low speed pulse channel, i.e. PA200.3=0 (factory default).

In case of open-collector pulse input, the interference tolerance for input signal will decrease. In case of deviation due to interference, changes should be made in the following user parameters.

#### 1) Example of I/O signal time sequence

- The interval between S-ON signal and input pulse instructions should be above 40ms. If this interval is less than 40ms, servo drive may fail to receive the pulse instructions.
- Please set CLR signal to be above 20  $\mu\text{s}$ .

Pulse forms	Maximum frequency	Specifications
SIGN+ PULS	500Kbps. Open-collector: 200Kbps	
CW+ CCW	500Kbps. Open-collector: 200Kbps	
A phase+ B phase	200Kbps. Open-collector: 150Kbps	

## 2) Connection examples

Refer to Chapter 3.4.4

### 8.4.4 Smoothness

The servo drive can filter pulse instructions within certain frequency ranges.

PA214	Position instruction acceleration/deceleration time constant 1			
	Range	Unit	Default	Effective
	0~1000	0.1ms	0	Immed
Position instruction acceleration/deceleration time constant 2				
PA215	Range	Unit	Default	Effective
	0~1000	0.1ms	0	Immed
Position instruction average-moving filter				
PA216	Range	Unit	Default	Effective
	0~500	0.1ms	0	Immed

If position instruction acceleration/deceleration time constants (PA214, PA215) are changed, the changed value takes effect only if there's no simultaneous pulse input. In order to truly reflect the set value, please input CLR signal to prohibit pulse instructions.

Even in the following cases, motor can operate smoothly. Also this setting has no

effect on movement amount (instruction pulse count).

- The upper controller that sends the instructions can't accelerate or decelerate.
- The frequency of instruction pulse is low
- The electronic gear ratio is relatively high (more than 10 times)

**Effects of PA214, PA215, PA216 are shown as below:**

#### 8.4.5 Positioning completed signal (COIN)

This signal means that servo motor positioning is completed at position control.

Type	Signal	Pin	Level	Name
Output	COIN	CN2-5, 4 (default)	ON=L level	Positioning completed
			OFF=H level	Positioning not completed

PA525	COIN signal width			
	Range	Unit	Default	Effective
	0~65535	1pulse	10	Immed

- If the difference between the upper controller's instruction pulse input count and the servo motor's movement amount (deviation pulse) is lower than the set value of this use parameter, then the COIN signal will output; this also depends on the electronic gear setting.
- If the set value of PA525 is too high and servo is running in low speed, COIN signal may still output even though positioning is not completed. Please pay close attention to this.

- 
- Setting of this user parameter does not affect the final positioning precision.
  - Please refer to 3.4.3 Allocation of I/O signals.
- 

#### *8.4.6 Positioning near signal (NEAR)*

#### **8.4.7 Pulse input inhibited (INHIBIT)**

This is a function that stops (inhibits) instruction pulse input counting in case of position control.

It is in servo locking (clamping) state when this function is used.

Type	Signal	Pin	Level	Name
Input	INHIBIT	CN2-31 (default)	ON=L level	INHIBIT is ON
			OFF=H level	INHIBIT is OFF

INHIBIT is only valid in position control mode.

---

## 8.5 Speed control operations

### 8.5.1 Parameter settings

Parameter		Meaning		
PA000	h.□□1□	Control mode selection: speed control		
When PA000.1 = 1, 5, 7, 9, speed control is being used.				
PA301	Speed instruction gain			
	Range	Unit	Default	Effective
	150~3000	0.01V/ rated speed	600	-

This parameter is for setting the instruction voltage (V-REF) at motor rated speed.

**Input voltage range: DC  $\pm 2V \sim \pm 10V$  / rated speed**

Examples:

- PA301=600 means that with 6V input, the motor will run at the rated speed (default);
- PA301=1000 means that with 10V input, the motor will run at the rated speed.

### 8.5.2 Input signals

#### 1) Speed instruction input

If speed instruction is sent to the servo drive, servo motor will run at a speed proportional to input voltage.

Type	Signal	Pin	Name
Input	V-REF	CN2-20	Speed instruction input
	AGND	CN2-29	GND for speed instruction input

Please use multi-strand twisted wire to prevent interferences.

Programmable controller and so on are used for connection with the instruction controller's speed instruction output terminal in case of position control by

## 2) Proportional action instruction signal (P-CON)

Type	Signal	Pin	Level	Name
Input	P-CON	To be allocate d	ON=L level	Operate the servo drive in proportional (P) mode;
			OFF=H level	Operate the servo drive in proportional & integral (PI) mode

- P-CON signal is a signal in respect of which speed control mode is selected from PI (proportional and integral) or P (proportional) control.
- If it's set to P, then control can relieve motor rotation and slight vibration caused by speed instruction input drifting.
- Input instruction: It can progressively reduce servo motor rotation caused by drifting at 0V, but servo rigidity (support strength) decreases at stop.
- **This signal is temporarily unavailable.**

### 8.5.3 Instruction offset adjustment

When in speed control mode, even with 0V instruction, the motor may still rotate at a slight speed. This happens when instruction voltage of upper controller or external circuit has slight (mV unit) deviation (offset). In this case, instruction offset can be adjusted automatically or manually by using the panel operator. Please use automatic or manual offset adjust by referring to Chapter 6.8 & 6.9.

Automatic offset adjustment is the function of offset measuring and automatic voltage adjustment. When the voltage instruction of upper controller and external circuit is deviated, the servo drive will adjust the offset automatically as follows:

#### 1) Analog instruction automatic offset adjustment (AF 06)

Please refer to Chapter 6.8.

#### 2) Speed instruction manual offset adjustment (AF 07)

Use AF 07 in following situations (Please refer to Chapter 6.9) :

- When servo is locked and deviation pulse is set to 0, AF 06 can't be used.
- When user wants to set offset to a certain value;
- When the offset value is confirmed by AF 06.

### 8.5.4 Soft start

Soft start is the function that phase step speed instruction input is transformed to instruction with certain acceleration and deceleration curves inside servo drive, thus to achieve smooth operations.

PA303	<b>Soft start acceleration time</b>			
	Range	Unit	Default	Effective
	0~5000	1ms	0	Immed
PA304	<b>Soft start deceleration time</b>			
	Range	Unit	Default	Effective
	0~5000	1ms	0	Immed

- PA303: Acceleration time from 0rpm to 1000rpm;
- PA304: Deceleration time from 1000rpm to 0rpm.

### 8.5.5 Speed instruction filter time constant

PA302	<b>Speed instruction filter time constant</b>			
	Range	Unit	Default	Effective
	0~1000	0.01ms	40	Immed

Analog speed instruction (V-REF) is input through 1-time relay filter to smooth speed instruction. The responsiveness will be reduced if the set value is too large.

### 8.5.6 Zero-speed clamp function

This is a function used when upper controller is not configured with position loop in case of speed control.

If zero-speed clamp (ZEROspd) (PA300.3=0) signal is set to be ON, or input voltage of speed instruction (V-REF) (PA300.3 = 1) is below PA316 (zero-speed clamp grade), servo drive is configured with position loop inside, and speed instruction is ignored and servo motor is stopped in the servo locking state. The servo motor is clamped to within  $\pm 1$  pulse at the position where zero-speed clamp is effective, and it will return to the zero-speed clamp position even if turned by external force.

Parameter	Meaning
PA300	<b>Speed control switch 1: speed dead zone control</b>
	PA300.3=0: use input signal ZEROspd
	PA300.3=1: automatic, use PA316 setting

PA316	Zero-speed clamp grade			
	Range	Unit	Default	Effective
	1~2000	1rpm	30	Immed

This is to set the motor into automatic zero-speed clamp state when speed is lower than PA316 setting. PA316 should be lower than maximum motor speed.

Type	Signal	Pin	Level	Name
Input	ZEROPSPD	To be allocated	ON=L level	Zero-speed clamp function ON
			OFF=H level	Zero-speed clamp function OFF

Please refer to 3.4.3 Allocation of I/O signals.

### 8.5.7 Encoder signal output

Pulse feedbacks from the encoder are processed inside the servo drive before outputting to the upper controller.

Type	Signal	Pin	Name
Output	PAO	CN2-21	Encoder Output A Phase
	/PAO	CN2-22	Encoder Output /A Phase
Output	PBO	CN2-25	Encoder Output B Phase
	/PBO	CN2-23	Encoder Output /B Phase
Output	PZO	CN2-13	Encoder Output Z Phase (reference point)
	/PZO	CN2-24	Encoder Output /Z Phase (reference point)

- **Output phase status**

Please make servo drive rotate by two turns before using servo drive's Z phase pulse output for mechanical reference point reset action. If this can't be done due to the structure of the mechanical system, please implement reference point reset action at speed below 600rpm (calculated according to servo motor's rotating speed).

- **Frequency division**

This is a transformation process of the encoder pulse feedbacks by changing the density of pulses. The parameter is PA210.

- **Encoder resolution (frequency-division) setting**

PA210	Encoder resolution (frequency-division) setting			
	Range	Unit	Default	Effective
	16~16384	1Pulse/ rev	16384	Immed

The setting range is dependent on the encoder resolution.

Encoder specification	Resolution	Pulse per revolution	Range
Line-saving encoder	20000	5000ppr	16~5000
17-bit	131072	32768ppr	16~16384

- **Example: PA210=16**

**PA 210 Value: 16**

### 8.5.8 Speed instruction reached (VCMP)

When motor rotation speed is same as speed instruction, VCMP will output

Type	Signal	Pin	Level	Name
Output	VCMP	To be allocated	ON=L level	Same speed
			OFF=H level	Not same speed

VCMP needs to be allocated by PA510. Please refer to 3.4.3 Allocation of I/O signals.

PA517	VCMP signal detection width			
	Range	Unit	Default	Effective
	0~100	rpm	10	Immed

If the difference between motor speed and instruction speed is less than PA517 value, VCMP will output.

For example, PA517=100, speed instruction is 200rpm, if motor speed is within 1900rpm to 2100rpm, VCMP will be ON.

## 8.6 Torque control operations

### 8.6.1 Parameter settings

When using analog instructions for torque control, following parameters need to be set:

Parameter		Meaning	
PA000		Control mode selection: torque control	

PA400	Torque instruction gain			
	Range	Unit	Default	Effective
	10~100	0.1V/ rated torque	30	Immed

This parameter is for setting the instruction voltage (T-REF) at motor rated torque.

#### ▪ Examples

PA400=30: Input 3VDC will output rated torque (Default)

PA400=100: Input 10VDC will output rated torque

PA400= 20: Input 2VDC will output rated torque

## 8.6.2 Input signals

If speed instruction is sent to the servo drive, servo motor will run at a speed proportional to input voltage.

Type	Signal	Pin	Name
Input	T-REF	CN2-18	Torque instruction input
	AGND	CN2-19	GND for torque instruction input

When PA000.1 = 2, 6, 8, 9, torque control is being used.

**Input voltage range: DC $\pm$ 2V ~  $\pm$ 10V / rated torque**

dP 10 is for Internal torque instruction (value in relation to the rated torque) display in internal torque instruction in torque / speed / position control modes.

### 8.6.3 Instruction offset adjustment

When in torque control mode, even with 0V instruction, the motor may still output at a slight torque. This happens when instruction voltage of upper controller or external circuit has slight (mV unit) deviation (offset). In this case, instruction offset can be adjusted automatically or manually by using the panel operator. Please use automatic or manual offset adjust by referring to Chapter 6.8 & 6.10.

Automatic offset adjustment is the function of offset measuring and automatic voltage adjustment. When the voltage instruction of upper controller and external circuit is deviated, the servo drive will adjust the offset automatically as follows:

#### 1) Analog instruction automatic offset adjustment (AF 06)

Please refer to Chapter 6.8.

#### 2) Torque instruction manual offset adjustment (AF 08)

Use AF 08 in following situations (Please refer to Chapter 6.10) :

- When servo is locked and deviation pulse is set to 0, AF 06 can't be used.
- When user wants to set offset to a certain value;
- When the offset value is confirmed by AF 06.

## 8.6.4 Speed limit in torque control mode

When servo motor needs to be output torque following torque instructions, motor's rotating speed is not controlled. If instruction torque is too large due to the load torque at mechanical side, motor's rotating speed may increase too much. As a protection measure at mechanical side, servo motor's rotating speed needs to have limits in torque control mode.

### ▪ Speed limit in torque control mode selection

Parameter		Meaning	
PA002	d.□□0□	Use PA407 as speed limit (internal speed limit)	
	d.□□1□	Use V-REF & PA301 setting as speed limit (external speed limit)	

### ▪ Speed limit in torque control mode

PA407	Speed limit in torque control mode			
	Range	Unit	Default	Effective
	0~5000	rpm	1500	Immed

When PA002.1=0, settings of this parameter is effective.

Value of PA407 shall not exceed maximum motor speed.

### ▪ External speed limit

Type	Signal	Pin	Name
Input	V-REF	CN2-5	External speed limit
	AGND	CN2-6	GND for external speed limit

PA301 setting has no polarity.

PA301	Speed instruction gain			
	Range	Unit	Default	Effective
	150~3000	0.01 V/rated speed	600	Immed

### ▪ Output signal when speed is in limit

Type	Signal	Pin	Level	Name
Output	VLT+	To be allocated	ON=L level	In speed limit status
	VLT-	To be allocated	OFF=H level	Not in speed limit status

This signal is temporarily unavailable.

## 8.7 Internal speed control

Internal speed control is to set 8 speeds beforehand through parameters inside servo drive and to select among them by using external input signals INSPD2, INSPD1 and INSPD0.

It's unnecessary to configure speed generator or pulse generator outside.

<b>INSPD2</b>	<b>INSPD1</b>	<b>INSPD0</b>	<b>Internal speed selection</b>
0 (Invalid)	0 (Invalid)	0 (Invalid)	Internal speed 0 (PA307)
0 (Invalid)	0 (Invalid)	1 (Valid)	Internal speed 1 (PA308)
0 (Invalid)	1 (Valid)	0 (Invalid)	Internal speed 2 (PA309)
0 (Invalid)	1 (Valid)	1 (Valid)	Internal speed 3 (PA310)
1 (Valid)	0 (Invalid)	0 (Invalid)	Internal speed 4 (PA311)
1 (Valid)	0 (Invalid)	1 (Valid)	Internal speed 5 (PA312)
1 (Valid)	1 (Valid)	0 (Invalid)	Internal speed 6 (PA313)
1 (Valid)	1 (Valid)	1 (Valid)	Internal speed 7 (PA314)

### 8.7.1 Parameter settings

Parameter		Meaning		
<b>PA000</b>	h. □□3□	Control mode selection: internal speed control		
<b>PA307</b>	<b>Internal speed 0</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	100	Immed
<b>PA308</b>	<b>Internal speed 1</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	200	Immed
<b>PA309</b>	<b>Internal speed 2</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	300	Immed
<b>PA310</b>	<b>Internal speed 3</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	400	Immed
<b>PA311</b>	<b>Internal speed 4</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	500	Immed
<b>PA312</b>	<b>Internal speed 5</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	600	Immed
<b>PA313</b>	<b>Internal speed 6</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	700	Immed
<b>PA314</b>	<b>Internal speed 7</b>			
	Range	Unit	Default	Effective
	−5000~5000	rpm	800	Immed
PA307~PA314 settings should not exceed maximum motor speed.				

### 8.7.2 Input signals

Type	Signal	Pin	Definitions	
Input	INSPD0	To be allocated	Internal speed register 0	
	INSPD1	To be allocated	Internal speed register 1	
	INSPD2	To be allocated	Internal speed register 2	

Please refer to 3.4.3 Allocation of I/O signals.

## 8.8 Internal position control

When **PA000.1=A**, servo drive is in internal position mode and can perform simple single-axis motions without upper controllers.

Up to 16 positions can be set. Each position can set its own distance, speed, acceleration/deceleration time, stop (dead zone) time etc. This internal position control mode also has homing function (look for zero point).

### ■ Internal position control switches & selections (PA700, PA770)

- 1) Use external INPOS0, INPOS1, INPOS2, INPOS3 to choose certain positions. Triggers can be set by PA770.1: external I/O (PTRG) or INPOS0, INPOS1, INPOS2, INPOS3.
- 2) Use external I/O (PTRG) to trigger cycle run. Cycle begins with PA700.2 and ends with PA700.3.
- 3) Internal position runs in cycles at internal timing. Cycle begins with PA700.2 and ends with PA700.3.

### ■ Internal position distance settings (PA701 to PA732)

Each distance is set by two parameters in pairs, for example, PA701 & PA702, PA703 & PA704 etc. Values in these paired parameters are hexadecimal, with symbols and combine to a 32-bit position data.

For example, PA702 is 0x 0007, PA701 is 0x A120, then position data is 0x0007A120, means 500000 pulses. For a 5000-line encoder, each turn creates 20,000 pulses. Thus the position data means 25 turns.

Notes:

- 1) Setting range is [0x0000, 0xFFFF].
- 2) Electronic gear ratio settings will have counter-effect on distance.
- 3) These parameters can also be set by communications. (Refer to Chapter 10)

### ■ Internal position speeds (PA733 to PA748)

Electronic gear ratio will have counter-effect on speeds.

### ■ Internal position acceleration/deceleration time (PA749 to PA764)

For settings please refer to Chapter 8.4.4.

### ■ Internal position stop (dead zone) time (PA765)

This parameter is only valid when PA700.0=2. (Internal position runs in cycles at internal timing)

This is time between CMD\_OK (internal position control position instruction completion signal output) and the execution of next action.

### 8.8.1 Parameter settings

Parameter		Meaning		
<b>PA000</b>	h.□□A□	Control mode selection: internal position control		
Parameter		Meaning		
<b>PA700</b>	h.□□□0	INPOS selects internal position section.		
	h.□□□1	PTRG triggers internal position run and in cycle.		
	h.□□□2	Internal position runs in cycles at internal timing.		
	h.□□0□	Incremental position		
	h.□□1□	Absolute position		
	h.X□□□	Cycle run starting position		
	h.X□□□	Cycle run ending position		
<b>PA701</b>	<b>Internal position 0 distance low place</b>			
	Range	Unit	Default	Effective
	0x0000~0xFFFF	pulse	0x4E20	Immed
<b>PA702</b>	<b>Internal position 0 distance high place</b>			
	Range	Unit	Default	Effective
	0x0000~0xFFFF	pulse	0x0000	Immed
~~				
<b>PA731</b>	<b>Internal position 15 distance low place</b>			
	Range	Unit	Default	Effective
	0x0000~0xFFFF	pulse	0xE200	Immed
<b>PA732</b>	<b>Internal position 15 distance high place</b>			
	Range	Unit	Default	Effective
	0x0000~0xFFFF	pulse	0x0004	Immed
<b>PA733</b>	<b>Internal position 0 speed</b>			
	Range	Unit	Default	Effective
	0~5000	rpm	100	Immed
~~				
<b>PA748</b>	<b>Internal position 15 speed</b>			
	Range	Unit	Default	Effective
	0~5000	rpm	100	Immed
<b>PA749</b>	<b>Internal position 0 acceleration/deceleration time</b>			
	Range	Unit	Default	Effective
	0~500	ms	0	Immed
~~				
<b>PA764</b>	<b>Internal position 15 acceleration/deceleration time</b>			
	Range	Unit	Default	Effective
	0~500	ms	0	Immed

<b>PA765</b>	<b>Internal position dead zone time</b>			
	Range	Unit	Default	Effective
<b>PA768</b>	<b>JOG speed in internal position control mode</b>		100	Immed
	Range	Unit	Default	Effective
	0~65335	ms	100	Immed
	0~5000	rpm	100	Immed

Value of PA733~PA748 shall not exceed maximum motor speed.

Parameter	Meaning																								
<b>PA770</b>	<p><b>Internal position control switch 2</b></p> <p>b. </p> <table border="1"> <tr> <td colspan="2"><b>Trigger signal selection</b></td> </tr> <tr> <td>0</td> <td>Use PTRG</td> </tr> <tr> <td>1</td> <td>Use internal position selection signals: INPOS0、INPOS1、INPOS2、INPOS3</td> </tr> </table> <table border="1"> <tr> <td colspan="2"><b>Trigger time sequence selection</b></td> </tr> <tr> <td>0</td> <td>Only receive new trigger signal when current position is completed (CMD-OK)</td> </tr> <tr> <td>1</td> <td>Can receive new trigger even though current position is not completed</td> </tr> </table> <table border="1"> <tr> <td colspan="2"><b>PZERO function selection</b></td> </tr> <tr> <td>0</td> <td>Stop.</td> </tr> <tr> <td>1</td> <td>Pause.</td> </tr> </table> <table border="1"> <tr> <td colspan="2"><b>Software position limit enabling</b></td> </tr> <tr> <td>0</td> <td>No enabling.</td> </tr> <tr> <td>1</td> <td>Can enable. <b>Software position limit enabling</b>																									
0	No enabling.																								
1	Can enable. PA756, PA757 are positive limits; PA758, PA759 are negative limits.																								

## 8.8.2 Input signals

Type	Signal	Pin	Level	Meaning
Input	ZPS	To be allocated	ON=L level	External zero switch signal ON
			OFF=H level	External zero switch signal OFF
	PZERO	To be allocated	ON=L level	Internal position control stops: valid
			OFF=H level	Internal position control stops: invalid
	INPOS0	To be allocated	ON=L level	INPOS0 signal valid
			OFF=H level	INPOS0 signal invalid
	INPOS1	To be allocated	ON=L level	INPOS1 signal valid
			OFF=H level	INPOS1 signal invalid
	INPOS2	To be allocated	ON=L level	INPOS2 signal valid
			OFF=H level	INPOS2 signal invalid
	INPOS3	To be allocated	ON=L level	INPOS3 signal valid
			OFF=H level	INPOS3 signal invalid
	PTRG	To be allocated	OFF (H level) to ON (L level)	PTRG signal valid
	P-POS	To be allocated	ON=L level	P-POS signal valid
			OFF=H level	P-POS signal invalid
	N-POS	To be allocated	ON=L level	N-POS signal valid
			OFF=H level	N-POS signal invalid
	SHOME	To be allocated	OFF (H level) to ON (L level)	SHOME signal valid

Please refer to 3.4.3 Allocation of I/O signals.

### ■ External zero switch signal (ZPS)

Used for homing functions only. Please refer to Chapter 8.9.

### ■ Internal position control stops (PZERO)

When PZERO is valid in internal position control, the motor stops and stays in clamping status. PA770.2 can select whether this is a stop or pause.

If PA770.2=0 (stop), homing process needs to restart after PZERO becomes invalid again.

If PA770.2=1 (pause), homing process will continue after PZERO becomes invalid again.

## ■ Internal position register (INPOS0、INPOS1、INPOS2、INPOS3)

INPOS0, INPOS1, INPOS2, INPOS3 combines to achieve 16-position control

<b>INPOS3</b>	<b>INPOS2</b>	<b>INPOS1</b>	<b>INPOS0</b>	<b>Internal position selection</b>
0 (invalid)	0 (invalid)	0 (invalid)	0 (invalid)	Position 0 (PA702&PA701)
0 (invalid)	0 (invalid)	0 (invalid)	1 (valid)	Position 1 (PA704&PA703)
0 (invalid)	0 (invalid)	1 (valid)	0 (invalid)	Position 2 (PA706&PA705)
0 (invalid)	0 (invalid)	1 (valid)	1 (valid)	Position 3 (PA708&PA707)
0 (invalid)	1 (valid)	0 (invalid)	0 (invalid)	Position 4 (PA710&PA709)
0 (invalid)	1 (valid)	0 (invalid)	1 (valid)	Position 5 (PA712&PA711)
0 (invalid)	1 (valid)	1 (valid)	0 (invalid)	Position 6 (PA714&PA713)
0 (invalid)	1 (valid)	1 (valid)	1 (valid)	Position 7 (PA716&PA715)
1 (valid)	0 (invalid)	0 (invalid)	0 (invalid)	Position 8 (PA718&PA717)
1 (valid)	0 (invalid)	0 (invalid)	1 (valid)	Position 9 (PA720&PA719)
1 (valid)	0 (invalid)	1 (valid)	0 (invalid)	Position 10 (PA722&PA721)
1 (valid)	0 (invalid)	1 (valid)	1 (valid)	Position 11 (PA724&PA723)
1 (valid)	1 (valid)	0 (invalid)	0 (invalid)	Position 12 (PA726&PA725)
1 (valid)	1 (valid)	0 (invalid)	1 (valid)	Position 13 (PA728&PA727)
1 (valid)	1 (valid)	1 (valid)	0 (invalid)	Position 14 (PA730&PA729)
1 (valid)	1 (valid)	1 (valid)	1 (valid)	Position 15 (PA732&PA731)

This is illustrated as below:

## ■ Internal position control trigger (PTRG)

When PA700.0=0 or 1, and PA770.1=0 in internal positon control mode, the rising edge is valid.

Time sequence of PTRG is illustrated below:

## ■ Internal position control Forward JOG (P-POS)

In internal position control mode, even during homing or internal position sections, when P-POS signal becomes valid, position instruction will cut to forward JOG immediately and all current running instructions will be canceled and the cycle run will restart to starting point. PA768 is JOG speed in internal position control mode.

## ■ Internal position control Reverse JOG (N-POS)

## ■ Internal position control homing start (SHOME)

In internal position control mode, when SHOME signal becomes valid, all current running instructions will be canceled to cut into homing operations. The rising edge of this signal is valid.

### 8.8.3 Output signals

Type	Signal	Pin	Status	Meaning
Output	HOME	To be allocated	Valid	Internal position control homing completed
			Invalid	Internal position control homing not completed
	CMD-OK	To be allocated	Valid	Internal position control instruction completed
			Invalid	Internal position control instruction not completed
	MC-OK	To be allocated	Valid	Internal position control positioning & command completed
			Invalid	Internal position control positioning & command not completed

Please refer to 3.4.3 Allocation of I/O signals.

#### ■ Internal position control homing completion signal (HOME)

When homing is completed, and position coordinates are valid, and position counter is valid, this signal is ON.

- This signal is OFF at power on;
- When homing is completed, this signal is ON;
- After running one position section, this signal is OFF;
- When SHOME triggers, this signal is OFF;
- When homing is completed again, this signal is ON;
- When inputting PZERO to stop homing, this signal is OFF.

#### ■ Internal position control instruction completion signal (CMD-OK)

- When entering internal position control mode, this signal is ON;
- When during instruction executing, this signal is OFF;
- When position instructions finish executing, this signal is ON.

**This signal only means the completion of instructions, not necessarily actual motor positioning.**

#### ■ Internal position control positioning & command completion (MC-OK)

This signal means both the completion of positioning & commands.

When CMD-OK & COIN are both ON, this signal is ON; otherwise OFF.

## 8.9 Homing function

Normally there should be a reference point (zero) switch on working tables and is used to determine coordinate system zero position for point-to-point controls. Homing is needed when power-on or after each processing for next movement. In internal position control mode, upper controller gives homing start (SHOME) signal and the servo drive will execute homing functions automatically. Homing modes, homing speeds and offset can all be set through PA771, PA775, PA776, PA777, and PA778.

### ■ Homing mode selections

Parameter	Meaning																												
<b>PA771</b>	<table border="1"> <tr> <td colspan="2"><b>Homing rotational direction</b></td> </tr> <tr> <td>0</td> <td>Forward rotation</td> </tr> <tr> <td>1</td> <td>Reverse rotation</td> </tr> <tr> <td colspan="2"><b>Homing pattern selection</b></td> </tr> <tr> <td>0</td> <td>After contacting zero switch, look for Z pulse by rotating backward</td> </tr> <tr> <td>1</td> <td>After contacting zero switch, look for Z pulse by rotating forward</td> </tr> <tr> <td>2</td> <td>After contacting zero switch, rotate backward, not look for Z pulse</td> </tr> <tr> <td>3</td> <td>After contacting zero point switch, rotate forward, not look for Z pulse</td> </tr> <tr> <td colspan="2"><b>Homing completion operation</b></td> </tr> <tr> <td>0</td> <td>Clear all position data</td> </tr> <tr> <td>1</td> <td>Not clear all position data</td> </tr> <tr> <td colspan="2"><b>Homing signal selection</b></td> </tr> <tr> <td>0</td> <td>Use ZPS</td> </tr> <tr> <td>1</td> <td>Use Z pulse</td> </tr> </table>	<b>Homing rotational direction</b>		0	Forward rotation	1	Reverse rotation	<b>Homing pattern selection</b>		0	After contacting zero switch, look for Z pulse by rotating backward	1	After contacting zero switch, look for Z pulse by rotating forward	2	After contacting zero switch, rotate backward, not look for Z pulse	3	After contacting zero point switch, rotate forward, not look for Z pulse	<b>Homing completion operation</b>		0	Clear all position data	1	Not clear all position data	<b>Homing signal selection</b>		0	Use ZPS	1	Use Z pulse
<b>Homing rotational direction</b>

1	Reverse rotation																												
<b>Homing pattern selection</b>																													
0	After contacting zero switch, look for Z pulse by rotating backward																												
1	After contacting zero switch, look for Z pulse by rotating forward																												
2	After contacting zero switch, rotate backward, not look for Z pulse																												
3	After contacting zero point switch, rotate forward, not look for Z pulse																												
<b>Homing completion operation</b>																													
0	Clear all position data																												
1	Not clear all position data																												
<b>Homing signal selection</b>																													
0	Use ZPS																												
1	Use Z pulse																												

### ■ Other homing parameters

PA775	<b>Homing speed before contacting zero signal</b>			
	Range	Unit	Default	Effective
PA776	<b>Homing speed after contacting zero signal</b>			
	Range	Unit	Default	Effective
PA777	<b>Zero switch offset low place</b>			
	Range	Unit	Default	Effective
PA778	<b>Zero switch offset high place</b>			
	Range	Unit	Default	Effective

---

**Important**

- When PA775, PA776 settings exceed maximum speed of the servo motor, actual value is still restricted as servo motor's maximum speed.
  - Zero position offset directions are determined by homing directions.
  - Homing functions are suitable for internal position control (junction instruction) and position control (pulse instruction).
  - During homing, servo drive does not receive pulse commands.
- 

**■ Description of the homing process**

- When SHOME rising edge is detected, motor runs at direction set by PA771.0 and speed set by PA772.
- When zero switch (reference point) signal ZPS is detected active, motor runs at speed set by PA775 after finding Z pulse according to PA771.1 setting.
- When ZPS is inactive, also after detected Z pulse, motor runs at speed set by PA776 and starts calculating zero switch offset pulse numbers.
- When zero switch offset pulse number is reached, motor stops and outputs HOME signal.
- Normally set PA775 at high speed and PA776 at low speed. Note that if PA776 is set too high, homing accuracy will be affected.

- PA771.1=0: After contacting zero switch, look for Z pulse by rotating backward.

- PA771.1=1: After contacting zero switch, look for Z pulse by rotating forward.

- PA771.1=2: After contacting zero switch, rotate backward, not look for Z pulse.

- PA771.1=3: After contacting zero switch, rotate forward, not look for Z pulse.

## 8.10 Combination of different control modes

The servo can select two control modes and switch between them. Settings are as below:

### 8.10.1 Parameter settings

Parameter		Control mode combinations
PA000	h.□□4□	Internal speed control ↔ Position control
	h.□□5□	Internal speed control ↔ Speed control
	h.□□6□	Internal speed control ↔ Torque control
	h.□□7□	Position control ↔ Speed control
	h.□□8□	Position control ↔ Torque control
	h.□□9□	Torque control ↔ Speed control
	h.□□B□	Internal position control ↔ Position control

### 8.10.2 Input signal

- When C-MODE is invalid, first control mode is selected;
- When C-MODE is valid, second control mode is selected

# Chapter 9 Fault diagnosis

## 9.1 Alarms

<b>Code</b>	<b>Symptom/Cause</b>	<b>Clear</b>	<b>Solutions</b>
E.03	Wrong parameters & verifications	No	AF 05: parameter initialization.
E.04	Wrong parameter data format	No	AF 05: parameter initialization.
E.05	Abnormal internal circuit of current detection channel 1	No	Power off, then power on again after 1 minute.
E.06	Abnormal internal circuit of current detection channel 2	No	Power off, then power on again after 1 minute.
E.08	Servo drive internal communication error	No	1) Power off, then power on again after 1 minute; 2) Check motor earthing and whether next to interference source.
E.10	Broken encode line	No	1) Check encoder line; 2) Check if PA002.3 matches encoder type.
E.11	Encoder A/B pulse loss	No	1) Check encoder line; 2) Check grounding of both servo drive and motor; 3) Check shielding cable connections; 4) Separate encoder line from power supply cables.
E.12	Encoder Z pulse loss	No	Check encoder line.
E.13	Encoder UVW error	No	Check encoder line.
E.14	Encoder status error	No	Check encoder line.
E.15	Main power supply wiring error	No	1) Check if there is input phase loss; 2) Check if input voltage is correct; 3) Set PA001.2=1.
E.16	Regenerative circuit error	No	1) Check if input voltage is too low; 2) Set PA009.0=1 to disable this alarm.
E.17	Regenerative resistor error	No	1) Check if input voltage is too low; 2) Set PA009.0=1 to disable this alarm; 3) Check if regenerative resistor is already connector or if has error.
E.18	(Main circuit DC bus) under-voltage	No	1) Check if input voltage is correct; 2) Check if the relay works properly (should have sound when power on); 3) Increase value of PA512.
E.19	(Main circuit DC bus)	No	1) Check if input voltage is correct;

	over-voltage		<ul style="list-style-type: none"> <li>2) Check regenerative resistor;</li> <li>3) Reduce the value of PA512.</li> </ul>
E.20	IGBT alarm	No	<ul style="list-style-type: none"> <li>1) Check if drive matches motor (PA012) ;</li> <li>2) Reduce the value of PA402 &amp; PA403;</li> <li>3) Increase the value of PA104.</li> </ul>

E.22	Regenerative overload	Yes	<ul style="list-style-type: none"> <li>1) Increase acceleration/deceleration time (Position control: reduce PA100, increase PA214, PA215, PA216. Speed control: increase PA302, PA303, PA304) ;</li> <li>2) Increase PA010.2 if the resistor can withstand;</li> <li>3) Increase value of PA512.</li> </ul>
E.23	DB overload	Yes	
E.25	Deviation counter overflow (exceeds 256*65536)	Yes	<ul style="list-style-type: none"> <li>1) Check if motor can JOG properly;</li> <li>2) Check electronic gear ratio settings;</li> <li>3) Check if torque limit is correct;</li> <li>4) Check if there is limit switch.</li> </ul>
E.26	Position deviation exceeds setting value of PA528	Yes	<ul style="list-style-type: none"> <li>1) Check if motor can JOG properly;</li> <li>2) Check electronic gear ratio settings;</li> <li>3) Increase PA528;</li> <li>4) Check if there is limit switch.</li> </ul>
E.27	Motor speed exceeds maximum speed*1.2	Yes	<ul style="list-style-type: none"> <li>1) Check if motor UVW wirings are correct;</li> <li>2) Check if the PID parameters are correct or if load inertia is too high;</li> <li>3) Increase acceleration/deceleration time (Position control: reduce PA100, increase PA214, PA215, PA216. Speed control: increase PA302, PA303, PA304).</li> </ul>
E.28	Motor speed out of control	Yes	<ul style="list-style-type: none"> <li>1) Check if motor UVW wirings are correct;</li> <li>2) Check PID settings for responsiveness;</li> <li>3) Increase PA530 (if too high will disable the protection function).</li> </ul>
E.29	Motor out of control	Yes	<ul style="list-style-type: none"> <li>1) Check if motor UVW wirings are correct;</li> <li>2) Check if encoder type is correct (PA002.3) ;</li> <li>3) Check if drive matches motor (PA012) ;</li> <li>4) Reduce servo gains properly, such as increase filter (PA215, PA216).</li> </ul>
E.30	Electronic gear ratio value	Yes	<ul style="list-style-type: none"> <li>1) Check electronic gear ratio settings;</li> </ul>

	too high		2) Check input pulse frequency.
E.31	Internal data value too high: calculation is over 32-bit	Yes	1) Check electronic gear ratio settings; 2) Check input pulse frequency.
E.35	Input inhabitation	Yes	1) Check if there is limit switch signal input; 2) Set PA003.2=1 to disable this alarm.
E.36	Fully closed loop deviation too large	Yes	
E.44	Servo drive reset error	No	1) Time interval between power off & power on again shall be greater than 5 seconds; 2) Check if there is any interference source nearby.
E.45	Servo drive internal error 1	No	
E.46	Servo drive internal error 2	No	
E.47	Servo drive internal error 3	No	
E.50	17-bit serial encoder communicational error	No	1) Check if PA002.3 matches encoder type; 2) Check encoder line; 3) Replace the servo motor.
E.51	17-bit serial encoder ODD/EVEN place, stop place verification error	Yes	1) Check encoder line; 2) Check if there is any interference source nearby; 3) Check shielding wire connections; 4) Replace the servo motor;
E.52	17-bit serial encoder data verification error	Yes	Same as above.
E.53	17-bit serial encoder status domain stop place error	Yes	Same as above.
E.54	17-bit serial encoder SFOME stop place error	Yes	Same as above.
E.55	17-bit serial encoder over- speed	Yes	1) Check if motor axis displaced during power off; 2) Execute AF 12; 3) Check if absolute encoder has battery.
E.56	17-bit serial encoder absolute status error	Yes	1) Check if there is any interference source nearby; 2) Execute AF 11.
E.57	17-bit serial encoder counter error	Yes	1) Check if there is any interference source nearby; 2) Execute AF 11.
E.58	17-bit serial encoder multi- turn data overflow (exceeds 65535 turns)	Yes	1) Check if there is any interference source nearby; 2) Execute AF 11.
E.59	17-bit serial encoder over- heat	Yes	1) Check motor temperature; 2) Execute AF 12.

E.60	17-bit serial encoder multi-turn data error	Yes	1) Check battery voltage; 2) Execute AF 11.
E.61	17-bit serial encoder battery voltage less than 3.1V	Yes	1) Replace battery; 2) Execute AF 12
E.62	17-bit serial encoder battery voltage less than 2.5V	No	Same as above
E.63	17-bit serial encoder data not initialized	Yes	1) Check if PA002.3 matches encoder type; 2) Initialize 17-bit serial encoder.
E.64	17-bit serial encoder data & verification error	Yes	Same as above
E.67	Servo drive does not match the servo motor	Yes	1) Modify PA012 setting; 2) Disable this alarm by PA007.3 but may degrade motor performance or cause E.29; 3) Replace the servo drive or motor.
E.68	Same as above	Yes	Same as above
E.69	Same as above	Yes	Same as above
E.70	Absolute encoder data error	Yes	
E.76	IGBT over-heat	Yes	1) Check servo drive fan; 2) Check ventilation; 3) Set PA009.2=0 to disable this alarm.
E.77	Software limit switch alarm	Yes	1) Check if PA779~PA782 are correct; 2) Set PA770.3=0 to disable this alarm.

## 9.2 Warnings

Code	Symptom/Cause	Solutions
A.90	Position deviation (residual pulse) too much	<ul style="list-style-type: none"> <li>1) Check electronic gear ratio settings;</li> <li>2) Increase PA527;</li> <li>3) Check if there is limit switch.</li> </ul>
A.91	Overload	<ul style="list-style-type: none"> <li>1) Increase acceleration/deceleration time;</li> <li>2) Increase stop/start times;</li> <li>3) Increase PA010.3;</li> <li>4) Reduce load;</li> <li>5) Replace with a higher power servo.</li> </ul>
A.92	Regenerative overload	<ul style="list-style-type: none"> <li>1) Increase acceleration/deceleration time;</li> <li>2) Increase stop/start times;</li> <li>3) Increase PA010.2;</li> <li>4) Use a regenerative resistor with higher power but lower resistance</li> </ul>
A.95	Over-voltage warning	<ul style="list-style-type: none"> <li>1) Increase acceleration/deceleration time;</li> <li>2) Increase stop/start times;</li> <li>3) Reduce regenerative resistance;</li> <li>4) Reduce PA512.</li> </ul>
A.96	Under-voltage warning	<ul style="list-style-type: none"> <li>1) Check input voltage;</li> <li>2) Increase PA512.</li> </ul>
A.97	17-bit serial encoder battery voltage less than 3.1V	<ul style="list-style-type: none"> <li>1) Check battery voltage and wiring;</li> <li>2) Replace battery.</li> </ul>

# Chapter 10 Communications

## 10.1 Communication terminals

Please refer to chapter 3.3 for wirings of CN1.

- 1) If upper controller only connects to one servo drive, connect RJ45 (1) to upper controller and RJ45 (2) to a  $120\Omega$  resistor.
- 2) If upper controller connects to multiple servo drives, connect RJ45 (1) of first servo drive to upper controller and RJ45 (2) of first servo drive to RJ45 (1) of second servo drive. Connect all servo drives in this way and connect RJ45 (2) of last servo drive to a  $120\Omega$  resistor.
- 3) Do not connect pin 4 or pin 5 of RJ45.

## 10.2 Communication parameters

Parameter	Name	Range	Unit	Default	Effective
PA015	RS485 communication address	1~31		1	Immed
PA016	RS485 communication function selection	d.0000~0095		d.0095	Immed
	d. [3] [2] [1] [0]				
		RS485 bit rate			
		0	2400bps		
		1	4800bps		
		2	9600bps

		2	8, E, 1 (Modbus protocol, RTU mode)		
		3	8, O, 1 (Modbus protocol, RTU mode)		
		4	7, N, 2 (Modbus protocol, ASCII mode)		
		5	7, E, 1 (Modbus protocol, ASCII mode)		
		6	7, O, 1 (Modbus protocol, ASCII mode)		
		7	8, N, 2 (Modbus protocol, ASCII mode)		
		8	8, E, 1 (Modbus protocol, ASCII mode)		
		9	8, O, 1 (Modbus protocol, ASCII mode)		
		Reserved			
		Communicational data equivalent			
		0	Internal speed: 1rpm; internal torque: 1% rated torque.		
		1	Internal speed: 0.1rpm; internal torque: 0.1% rated torque.		

---

## 10.3 Communication protocol

When using RS-485 for serial communications, each servo drive must set its own axis number (PA015). There are two MODBUS modes: ASCII (American Standard Code for Information Interchange) or RTU (Remote Terminal Unit).

### 10.3.1 Encoding definitions

◆ **ASCII mode:**

Every 8-bit data consists of two ASCII bytes.

Byte symbol	'0'	'1'	'2'	'3'	'4'	'5'	'6'	'7'
ASCII code	30H	31H	32H	33H	34H	35H	36H	37H
Byte symbol	'8'	'9'	'A'	'B'	'C'	'D'	'E'	'F'
ASCII code	38H	39H	41H	42H	43H	44H	45H	46H

◆ **RTU mode:**

Every 8-bits data consists of two 4-bits hexadecimal bytes.

## 10.3.2 Byte structure

### ◆ 10-bits byte box (used for 7-bits data)

### ◆ 11-bits byte box (used for 8-bits data)

### 10.3.3 Communication data structure

◆ ASCII mode:

<b>STX</b>	Communication starting byte: ‘:’ (3AH)
<b>ADR</b>	Communication address: 1-byte contains 2 ASCII codes
<b>CMD</b>	Command code: 1-byte contains 2 ASCII codes
<b>DATA (n-1)</b>	Data content (n≤12): ..... Word number=n;
<b>DATA (0)</b>	Byte number=2n; ASCII code number=4n;
<b>LRC</b>	Command code: 1-byte contains 2 ASCII codes
<b>End 1</b>	End code 1: (0DH) (CR)
<b>End 0</b>	End code 0: (0AH) (LF)

**RTU mode**

<b>STX</b>	Static time exceeding 3.5 bytes
<b>ADR</b>	Communication address: 1-byte
<b>CMD</b>	Command code: 1-byte
<b>DATA (n-1)</b>	Data content (n≤12): ..... Word number=n;
<b>DATA (0)</b>	Byte number=2n;
<b>CRC</b>	Command code: 1-byte
<b>End 1</b>	Static time exceeding 3.5 bytes

Detailed explanations are as below:

➤ **STX (Communication starting)**

ASCII mode: ‘:’ byte (3AH).

RTU mode: Static time exceeding 3.5 bytes under current communication speed.

➤ **ADR (communication address)**

Valid communication address is between 1 and 127. For example: to communicate with servo drive of Axis 16 (hexadecimal: 10H):

ASCII mode: ADR='1', '0'=>‘1’=31H, ‘0’=30H

RTU mode: ADR = 10H

➤ **CMD (command code) & DATA (data content)**

DATA format is determined by CMD. Common CMD listed below:

Command	Meaning	Remarks
03H	Read N words, N≤29	Standard command 03
06H	Write 1 word	Standard command 06
10H	Write N words, N≤29	Standard command 10

---

**1) CMD: 03H (Read N words, N≤29)**

For example, to continuously read 2 words from starting address 0200H of servo drive Axis 01H:

**ASCII mode:**

Command		Response	
STX	‘:’	STX	‘:’
ADR	‘0’	ADR	‘0’
	‘1’		‘1’
CMD	‘0’	CMD	‘0’
	‘3’		‘3’
Starting address (high to low)	‘0’	Data quantity (bytes)	‘0’
	‘2’		‘4’
	‘0’		‘0’
	‘0’		‘0’
Data quantity (WORD)	‘0’	Starting address 0200H (high to low)	‘B’
	‘0’		‘1’
	‘0’		‘1’
	‘2’		‘F’
LRC Check (high to low)	‘F’	Second address 0200H (high to low)	‘4’
	‘8’		‘0’
End 1	(0DH)		‘E’
End 0	(0AH)		‘8’
		End 1	(0DH) (CR)
		End 0	(0AH) (LF)

**RTU mode:**

Command		Response	
ADR	01H	ADR	01H
CMD	03H	CMD	03H
Starting address (high to low)	02H	Data quantity (bytes)	04H
	00H		00H
Data byte number (high to low)	00H	Starting address 0200H (high to low)	B1H
	02H		1FH
CRC check low	C5H	Second address 0200H (high to low)	40H
CRC check high	B3H		A3H
		CRC check low	D4H
		CRC check high	

---

## 2) CMD: 06H (write one word)

For example, write 100 (0064H) to starting address 0200H of servo drive Axis 01H:

### ASCII mode:

Command		Response	
STX	‘:’	STX	‘:’
ADR	‘0’	ADR	‘0’
	‘1’		‘1’
CMD	‘0’	CMD	‘0’
	‘6’		‘6’
Starting address (high to low)	‘0’	Starting address 0200H (high to low)	‘0’
	‘2’		‘2’
	‘0’		‘0’
	‘0’		‘0’
Data content (high to low)	‘0’	Data content (high to low)	‘0’
	‘0’		‘0’
	‘6’		‘6’
	‘4’		‘4’
LRC Check (high to low)	‘9’	LRC Check (high to low)	‘9’
	‘3’		‘3’
End 1	(0DH) (CR)	End 1	(0DH) (CR)
End 0	(0AH) (LF)	End 0	(0AH) (LF)

### RTU mode:

Command		Response	
ADR	01H	ADR	01H
CMD	06H	CMD	06H
Starting address (high to low)	02H	Starting address (high to low)	02H
	00H		00H
Data content (high to low)	00H	Data content (high to low)	00H
	64H		64H
CRC check low	89H	CRC check low	89H
CRC check high	99H	CRC check high	99H

### 3) CMD: 10H (write N words, N≤29)

For example, write 100 (0064H), 102 (0066H) to starting address 0200H of servo drive Axis 01H:

**ASCII mode:**

Command		Response	
STX	‘:’	STX	‘:’
ADR	‘0’	ADR	‘0’
	‘1’		‘1’
CMD	‘1’	CMD	‘1’
	‘0’		‘0’
Starting address (high to low)	‘0’	Starting address (high to low)	‘0’
	‘2’		‘2’
	‘0’		‘0’
	‘0’		‘0’
Data word number (high place)	‘0’	Data word number (high to low)	‘0’
	‘0’		‘0’
Data word number (low place)	‘0’	Data word number (high to low)	‘0’
	‘2’		‘2’
Data byte number	‘0’	LRC Check (high to low)	‘9’
	‘4’		‘3’
Data 1 content (high to low)	‘0’	End 1	(0DH) (CR)
	‘0’	End 0	(0AH) (LF)
	‘6’		
	‘4’		
Data 2 content (high to low)	‘0’		
	‘0’		
	‘6’		
	‘6’		
LRC Check (high to low)	‘1’		
	‘D’		
End 1	(0DH) (CR)		
End 0	(0AH) (LF)		

---

**RTU mode:**

Command		Response	
ADR	01H	ADR	01H
CMD	10H	CMD	10H
Starting address (high to low)	02H 00H	Starting address (high to low)	02H 00H
Data word number (high to low)	00H 02H	Data word number (high to low)	00H 02H
Data byte number	04H	CRC check low	40H
Data 1 content	00H 64H	CRC check high	70H
Data 2 content	00H 66H		
CRC check low	50H		
CRC check high	11H		

---

➤ **LRC (ASCII mode) & CRC (RTU mode) detected error value calculation**

**ASCII mode:**

ASCII mode uses LRC (Longitudinal Redundancy Check) to detect error value. LRC detected error value is the sum from ADR to last data content and use 256 as unit to remove excess part (for example: sum is 128H, then only use 28H), and then calculate supplement number of 2.

**RTU mode:**

RTU mode uses CRC (Cyclical Redundancy Check) detected error value.

- Step 1: CRC register is a 16-bits register whose content is FFFFH;
- Step 2: **Exclusive OR** compute first byte of command & low place byte of 16-bits CRC register and store the result back to CRC register.
- Step 3: Check lowest place (LSB) of CRC register. If this place is 0, then move to the right by 1 place; If this place is 1, then CRC register value move to the right by 1 place and **Exclusive OR** compute with A001H.
- Step 4: Go back to Step 3 until Step 3 has been executed 8 times; then to Step 5.
- Step 5: Repeat Step 2 to Step 4 for next byte of the CMD until all bytes have been processed.

At this point, CRC register content is CRC detected error value.

Notes:

After calculated CRC detected error value, in command, shall first fill in CRC low place, then CRC high place.

**3) End1、End0 (communication end)**

**ASCII mode:**

(0DH) i.e. byte as '\r' (carriage return) & (0AH) i.e. byte as '\n' (new line), means communication end.

**RTU mode:**

Static time exceeding 3.5 bytes in current communication speed.

---

### 10.3.4 Communication troubleshooting

Common error causes are:

- When reading-writing parameters, data address is wrong;
- When writing parameters, data exceeds upper/lower limit of this parameter;
- Communication is interfered, data transmission error or verification error.

When above communication error occurs, the servo drive will continue running, meanwhile will send back an error frame.

Error frame format:

**Upper controller data frame:**

Start	Slave address	Command	Data address	Verification

**Servo drive feedback error frame:**

Start	Slave address	Response code	Error code	Verification

Error frame response code = command + 80H

Error code=00H: communication normal;

=01H: servo drive cannot recognize the request;

=02H: data address of the request does not exist in the servo drive;

=03H: data of the request is not allowed (exceeding upper/lower limit) ;

=04H: servo drive started to execute the request but failed;

For example: servo drive Axis number is 03H, write data 06H to parameter PA004. As both upper/lower limit of PA004 is 0, data cannot be written. Servo drive will send back an error frame; error code is 03H (exceeding upper/lower limit). Structure is as below.

**Upper controller data frame:**

Start	Slave address	Command	Data address	Verification
	03H	06H	0004H, 0006H	

**Servo drive feedback error frame:**

Start	Slave address	Response code	Error code	Verification
	03H	86H	03H	

**If slave address is 00H, this is broadcast data and the servo drive will send no feedback.**

## 10.4 Communication address

**Notes:** W/R: writable/readable (R: readable only; W: writable only)

Address	Meaning	Unit	Data type	W/R
0000~03E7H	Parameters in Chapter 12.3. Examples: PA005: 0005H PA101: 0065H PA307: 0133H		Unassigned hexadecimal Assigned hexadecimal Assigned 32-bit	W/R
0600~0628H:	Monitoring display parameters.			
0600H	Motor speed (dP 00)	rpm	Assigned hexadecimal	R
0601H	Motor feedback pulse number (encoder unit, lower 4 digits) (dP 01)	pulse	Assigned hexadecimal	R
0602H	Motor feedback pulse number (encoder unit, higher 5 digits) (dP 02)	pulse	Assigned hexadecimal	R
0603H	Input pulse number before electronic gear (user unit, lower 4 digits) (dP 03)	pulse	Assigned hexadecimal	R
0604H	Input pulse number before electronic gear (user unit, higher 5 digits) (dP 04)	pulse	Assigned hexadecimal	R
0605H	Deviation pulse number (encoder unit, lower 4 digits) (dP 05)	pulse	Assigned hexadecimal	R
0606H	Deviation pulse number (encoder unit, higher 5 digits) (dP 06)	pulse	Assigned hexadecimal	R
0607H	Speed instruction (analog voltage instruction) (dP 07)	0.01V	Unassigned hexadecimal	R
0608H	Internal speed instruction (dP 08)	rpm	Assigned hexadecimal	R
0609H	Torque instruction (analog voltage instruction) (dP 09)	0.01V	Unassigned hexadecimal	R
060AH	Internal torque instruction (value in relation to the rated torque) (dP 10)	%	Assigned hexadecimal	R
060BH	Torque feedback (value in relation to the rated torque) (dP 11)	%	Assigned hexadecimal	R
060CH	Input signal monitoring (dP 12)		Unassigned hexadecimal	R
060DH	Output signal monitoring (dP 13)		Unassigned hexadecimal	R
060EH	Instruction pulse frequency (dP 14)	0.1Khz	Assigned hexadecimal	R
060FH	DC bus voltage (dP 15)	V	Unassigned hexadecimal	R
0610H	Total operation time (dP 16)	H	Unassigned hexadecimal	R
0611H	Rotation angle (dP 17)		Unassigned hexadecimal	R
0612H	Exact position of absolute encoder (single-turn or multi-turn) (dP 18)	2 pulses	Unassigned hexadecimal	R
0613H	Number of encoder turns (only effective for multi-turn absolute encoders) (dP 19)	turn	Unassigned hexadecimal	R

0614H	Cumulative load factor (take the rated cumulative load as 100%) (dP 20)	%	Unassigned hexadecimal	R
0617H	Load inertial ratio (dP 23)	%	Unassigned hexadecimal	R
0618H	Effective gain monitoring (dP 24)		Unassigned hexadecimal	R
<hr/>				
0630H	Current alarm code		Unassigned hexadecimal	R
0631H	Current warning code		Unassigned hexadecimal	R
<hr/>				
0780H	Absolute encoder multi-turn data	turn	Unassigned hexadecimal	R
0781H	Absolute encoder single turn data high place	pulse	Unassigned 32-bit	R
0782H	Absolute encoder single turn data low place	pulse		R
<hr/>				
0783H	Motor feedback position low place	pulse	Assigned 32-bit	R
0784H	Motor feedback position high place	pulse		R
0785H	Motor reference position low place	pulse	Assigned 32-bit	R
0786H	Motor reference position high place	pulse		R

**Notes:**

All data is displayed in hexadecimal (16-bit or 32-bit). 32-bit data consists of two 16-bit data. For example, 0781H data is 0001H and 0782H data is 013AH; then absolute encoder single turn data is 0001013AH.

# Chapter 11 Product specifications

## 11.1 Servo drive specifications

### 11.1.1 Basic specifications

Input voltage	220VAC	Singe/Three Phase 220VAC -15%~+10%, 50/60Hz	
	380VAC	Three Phase 380VAC -15%~+15%, 50/60Hz	
Control mechanism		<ul style="list-style-type: none"><li>▪ Single/Three phase full wave rectification</li><li>▪ IGBT PWM control, sine-wave current control</li></ul>	
Feedback devices		<ul style="list-style-type: none"><li>▪ 5000-LINE LINE-SAVING (GAIN)</li><li>▪ 17-BIT SERIAL (ABSOLUTE)</li><li>▪ 20-BIT SERIAL (GAIN)</li></ul>	
Use conditions	Ambient temperature	<ul style="list-style-type: none"><li>▪ Use temperature: 0~+45°C</li><li>▪ Storage temperature: -20~55°C</li></ul>	
	Humidity	Below 90%RH (no freezing or condensing)	
	Vibration	4.9 m/s <sup>2</sup> ~19.6 m/s <sup>2</sup>	
	Protection class/cleanness	Protection class: IP10; Cleanness: 2. But should be: <ul style="list-style-type: none"><li>▪ With no corrosive or combustible gas</li><li>▪ With no water, oil or drug splashing</li><li>▪ With little dust, ash, salt or metallic powder</li></ul>	
	Altitude	Below 1000m	
Performance	Speed control precision		1:5000
	Speed fluctuation rate	Load fluctuation	0 ~100% load: below ±0.01% (at rated speed)
		Voltage fluctuation	Rated voltage ±10%: 0.001% (at rated speed)
		Temperature fluctuation	25 ±25°C: below ±0.1% (at rated speed)
	Torque control precision		±3% (repeatable)
	Soft start time		0~5s (acceleration or deceleration)
Input/output signals	Encoder pulse output (A phase, B phase, Z phase)		<ul style="list-style-type: none"><li>▪ 5000 line-saving encoder: 16~5000;</li><li>▪ 17-bit serial encoder: 16~16384;</li><li>▪ 20-bit serial encoder: 16~1,048,576.</li></ul>
	Sequential input signals		Pin number 8
			Functions S-ON, C-MODE, POT, NOT, etc.
	Sequential output signals	Pin number	4

			Functions ALM, COIN, CZ, BK-OFF, S-RDY, etc.	
Communication functions	RS485	1: N	With relay, maximum N=31	
		Address	By parameter setting	
		Devices	PC, upper controller	
Display/keypad		7 LED X 5 bit, 4 buttons		
Dynamic brake (DB) (optional)		At Servo OFF, forward/backward rotation inhibition, power OFF, or stop due to failure.		
Regenerative functions		Internal or external		
Over-travel (OT) protections		POT, NOT. DB, deceleration to stop, coast to stop.		
Protection functions		Over-current, over-voltage, under-voltage, over-load, regenerative fault, etc.		

## 11.1.2 Position/speed/torque control specifications

Position control	Feedforward compensation		0~100% (Unit: 1%)			
	Position completion width		0~65535 Encoder unit			
	Input signals	Pulse form	PULS+SIGN, CW+CCW, A+B			
		Pulse status	Support line-driver, open collector			
		Maximum input pulse frequency		PULS+SIGN	CW+CCW	A+B
			Long line-driver	4Mbps	4 Mbps	1 Mbps
			Line-driver	500Kbps	500Kbps	125Kbps
		Open-collector	200Kbps	200Kbps	200Kbps	200Kbps
		Clearance	Clear deviation pulses			
	Internal position	Position selection	External input signals			
Speed control	Soft start time		0~5s			
	Input signals	Instruction voltage	±10 V			
		Input resistance	Approximately 9kΩ			
	Internal speed	Speed selection	External input signals			
Torque control	Input signals	Instruction voltage	±10 V			
		Input resistance	Approximately 9kΩ			

### 11.1.3 Servo drive dimensions

A type case:

B type case:

---

### C type case:

Notes:

- Unit is mm.
- Dimensions are subject to changes without prior notice.

## 11.2 Servo motor specifications & dimensions

### General specifications

Working system: S1 continuous

Heat resistance class: B

Vibration: 5G

Insulation voltage class: AC1500V, 1 minute

Insulation resistance: DC500V, above 10MΩ

Installation mode: Flange

Working temperature: 0~40°C (no freezing)

Operating humidity: 20%~80% (no dewing)

Altitude: Below 1000m

Protections: Full-enclosed IP65 (except the shaft-through part)

## 60/80 Series

Servo Motor series	60 series		80 Series	
Servo Motor model	60DNMA2-0D20D	60DNMA2-0D40D	80DNMA1-0D75D	80DNMA1-0001D
Input voltage	220VAC			
Inertia	Medium	Medium	Medium	Medium
Rated power (W)	200	400	750	1000
Rated torque (N*m)	0.64	1.27	2.39	3.18
Rated current (A)	1.4	2.5	4.1	5.5
Maximum current (A)	4.2	7.5	12.5	15.1
Rated speed (rpm)	3000	3000	3000	3000
Maximum speed (rpm)	5000	5000	5000	5000
Torque constant (N*m/Amp)	0.45	0.508	0.58	0.43
Back EMF constant (V/Krpm)	29	33	40	40
Rotary inertia (with brake) (10-4Kg*m2)	0.14 (0.16)	0.67 (0.68)	0.88 (0.92)	1.12 (1.15)
Resistance (line-line) ( $\Omega$ )	8.4	4.28	1.5	1.21

# Chapter 12 Appendix

## 12.1 List of monitoring display functions

No.	Function	Unit
dP 00	<b>Motor speed</b> Display the motor operating speed	[rpm]
dP 01	<b>Motor feedback pulse number (encoder unit, lower 4 digits)</b> Display the lower 4 digits of the sum of motor encoder feedback pulse.	[1 encoder pulse]
dP 02	<b>Motor feedback pulse number (encoder unit, higher 5 digits)</b> Display the higher 5 digits of the sum of motor encoder feedback pulse.	[ $10^4$ encoder pulses]
dP 03	<b>Input pulse number before electronic gear (user unit, lower 4 digits)</b> Lower 4 digits of the sum of input pulse number in position control mode.	[1 input pulse]
dP 04	<b>Input pulse number before electronic gear (user unit, higher 5 digits)</b> Higher 5 digits of the sum of input pulse number in position control mode.	[ $10^4$ input pulses]
dP 05	<b>Deviation pulse number (encoder unit, lower 4 digits)</b> Lower 4 digits of the sum of deviation pulse number in position control mode.	[1 encoder pulse]
dP 06	<b>Deviation pulse number (encoder unit, higher 5 digits)</b> Higher 5 digits of the sum of deviation pulse number in position control mode.	[ $10^4$ encoder pulses]
dP 07	<b>Speed instruction (analog voltage instruction)</b> Voltage value of analog input in speed control mode, after correction of null shift. When the voltage exceeds $\pm 10V$ , it cannot be displayed correctly.	[0.1V]
dP 08	<b>Internal speed instruction</b> Internal speed instruction under speed control and position control.	[r/min]
dP 09	<b>Torque instruction (analog voltage instruction)</b> Voltage value of analog input in torque control mode, after correction of null shift. When the voltage exceeds $\pm 10V$ , it cannot be displayed correctly.	[0.1V]
dP 10	<b>Internal torque instruction (value in relation to the rated torque)</b> Internal torque instruction in torque / speed / position control modes.	[%]
dP 11	<b>Torque feedback (value in relation to the rated torque)</b> Torque feedback value in torque / speed / position control modes.	[%]

<b>dP 12</b>	<b>Input signal monitoring</b> Input signal status of CN2 connector	-
<b>dP 13</b>	<b>Output signal monitoring</b> Output signal status of CN2 connector	-
<b>dP 14</b>	<b>Instruction pulse frequency</b> Instruction pulse frequency of the upper controller in position control.	[0.1Khz]
<b>dP 15</b>	<b>DC bus voltage</b> DC bus voltage after rectification	[V]
<b>dP 16</b>	<b>Total operation time of the servo drive</b> If AF05 operation is implemented, the value will be reset.	[Hours]
<b>dP 17</b>	<b>Rotation angle</b> Display the electric rotational angle of the motor.	[deg]
<b>dP 18</b>	<b>Exact position of absolute encoder (single-turn or multi-turn)</b> This displays the absolute position data of the encoder in one turn.	[2 Encoder pulse]
<b>dP 19</b>	<b>Number of encoder turns (only for multi-turn absolute encoders)</b> This displays the number of turns of multi-turn absolute encoder.	[1 turn]
<b>dP 20</b>	<b>Cumulative load factor (take rated cumulative load as 100%)</b> Alarm grade during motor overload protection.	[%]
<b>dP 21</b>	<b>Regeneration load factor (take rated regeneration load as 100%)</b> Alarm grade during regeneration overload protection	[%]
<b>dP 22</b>	<b>DB load factor (take rated DB load as 100%)</b> Alarm grade during DB braking protection	[%]
<b>dP 23</b>	<b>Load inertial ratio</b> Display the ratio between load inertia and motor inertia.	[%]
<b>dP 24</b>	<b>Effective gain monitoring</b> 1: the first group of gains is effective 2: the second group of gains is effective	-
<b>dP 30</b>	<b>Subsidiary software version (refer to AF 10 for main software version)</b>	-
<b>dP 34</b>	<b>External linear encoder feedback pulse counts low place</b>	[1 encoder pulse]
<b>dP 35</b>	<b>External linear encoder feedback pulse counts high place</b>	[ $10^4$ encoder pulses]
<b>dP 38</b>	<b>Hybrid deviation low place</b>	[1 encoder pulse]
<b>dP 39</b>	<b>Hybrid deviation high place</b>	[ $10^4$ encoder pulses]
<b>dP 40</b>	<b>Voltage class (refer to PA000.3 for voltage class setting)</b>	-
<b>dP 46</b>	<b>IGBT temperature</b>	°C

---

## 12.2 List of auxiliary function parameters

No.	Function	Reference
<b>AF 00</b>	Display of alarm logging	6.2
<b>AF 01</b>	Position assignment (only active in position control mode)	6.3
<b>AF 02</b>	JOG run	6.4
<b>AF 03</b>	Panel lock	6.5
<b>AF 04</b>	Clearance of alarm logging	6.6
<b>AF 05</b>	Parameter initialization	6.7
<b>AF 06</b>	Analog instruction (speed & torque) automatic offset adjustment	6.8
<b>AF 07</b>	Speed instruction manual offset adjustment	6.9
<b>AF 08</b>	Torque instruction manual offset adjustment	6.10
<b>AF 09</b>	Overview of relevant motor parameters	6.11
<b>AF 10</b>	Display of main software version of servo drive	6.12
<b>AF 11</b>	Setting up absolute encoders	6.13
<b>AF 12</b>	Clearance of error logging for absolute encoders	6.13
<b>AF 15</b>	Manual detection of load inertia	6.14

## 12.3 List of parameters

### Legends:

- P: Parameter number.
- Descriptions: Parameter detailed descriptions.
- Range: Parameter setting range.
- Unit: Parameter unit.
- Defau: Parameter factory default setting value.
- Effective: Parameter effective time.
  - Immed: Parameter to be effective immediately.
  - Restart: Parameter to be effective after restart the servo drive.
- R: Remarks

P	Descriptions	Range	Unit	Defau	Effective	R

PA100	<b>First position loop proportional gain</b>	1~1000	1/s	40	Immed							
	This parameter determines the responsiveness of position control systems. The higher this value, the shorter positioning time. But if this value is set too high, vibrations can be caused.											
PA101	<b>First speed loop proportional gain</b>	1~3000	Hz	40	Immed							
	This parameter determines the responsiveness of speed control loops. If PA100 is increased, PA101 also has to be increased accordingly. But if this value is set too high, vibrations can be caused.											
PA102	<b>First speed loop integral time constant</b>	1~2000	0.1 ms	200	Immed							
	The lower this value, the stronger integral effects & counter-interference effects. But if this value is set too high, vibrations can be caused.											
PA103	<b>First speed detection filter</b>	0~1000	0.01ms	10	Immed							
	This is the time constant of low pass filter. The higher this value, the higher time constant. This can reduce motor noise but will also reduce system responsiveness.											
PA104	<b>First torque filter</b>	0~1000	0.01ms	30	Immed							
	This is to set the first grade hysteresis filter time constant of the torque instructions and can regulate vibrations caused by distorted resonance. The higher this value, the higher time constant. This can reduce motor noise but will also reduce system responsiveness.											
PA105	<b>Second position loop proportional gain</b>	1~1000	1/s	40	Immed
